(54) Title: TARGETED POLYLYSINE DENDRIMER THERAPEUTIC AGENT

(57) Abstract: The present invention relates generally to branched macromolecules bearing functional moieties. In particular, the invention relates to dendrimers, derived from lysine or lysine analogues, bearing a plurality of functional moieties. The invention further relates to the use of such macromolecules, particularly in therapeutic applications, and compositions comprising them.

WO 2008/017125 A1

MODIFIED MACROMOLECULE 2

FIELD OF THE INVENTION

The present invention relates generally to branched macromolecules. In particular, the invention relates to dendrimers, derived from lysine or lysine analogues, bearing a plurality
5 of functional moieties. The invention further relates to the use of such macromolecules, particularly in therapeutic applications, and compositions comprising them.

BACKGROUND OF THE INVENTION

The reference in this specification to any prior publication (or information derived from it), or to any matter which is known, is not, and should not be taken as an acknowledgment or
10 admission or any form of suggestion that that prior publication (or information derived from it) or known matter forms part of the common general knowledge in the field of endeavour to which this specification relates.

Identification of new compounds for use in pharmaceutical preparations is an important part of the search for more reliable and effective therapies. However just as important is
15 the development and modification of known compounds, reducing the risks associated with a new drug candidate and significantly reducing the development and cost to bring the drug to clinical development.

Many drugs fail in clinical trials either because their physical properties (particularly solubility) make them difficult to formulate, or because of a poor therapeutic index that
20 leads to toxic effects during the high drug concentrations that occur just after dosing. Other short comings include poor absorption, poor bioavailability, instability, systemic side effects due to an inability to target the drugs, and the inability to control their biodistribution, metabolism and renal or hepatic clearance once administered. Similarly some current products on the market can be improved with regard to such issues.

25 A number of approaches have been tried to improve a pharmaceutical compound's profile including the formulation of the pharmaceutical agent in a liposome, micellar or polymeric

- 2 -

micelle formulation, as well as covalent attachment of the pharmaceutical agent to a hydrophilic polymer backbone.

The characteristics of an ideal profile modifying agent include being a well defined structure, allowing precise control of the absorption, distribution, metabolism and excretion (ADME) characteristics (also referred to as pharmacokinetics) of the compound in question and advantageously being able to carry multiple compounds per agent or construct. The toxicity of a compound in question can be ameliorated through its controlled release from the said agent or construct, the body only being exposed to therapeutic plasma concentrations of the compound.

10 In recent years, dendritic macromolecules, or dendrimers, have been found to have increasing applications in biotechnology and pharmaceutical applications. Dendritic macromolecules are a special class of polymers with densely branched structures that are characterized by higher concentrations of functional moieties per unit of molecular volume than ordinary polymers. There are three subclasses of dendritic macromolecules: random
15 hyperbranched polymers; dendrigraft polymers and dendrimers (which includes dendrons), classified on the basis of the relative degree of structural control present in each of the dendritic architectures (Fréchet and Tomalia "Dendrimers and other Dendritic Polymers", Wiley and Sons, New York, 2002). The unique properties of dendrimers in particular, such as their high degree of branching, multivalency, globular architecture and well-
20 defined molecular weight, make them promising new scaffolds for pharmaceutical applications. In the past decade, research has increased on the design and synthesis of biocompatible dendrimers and their application to many areas of bioscience including macromolecular drugs, drug delivery, biomedical imaging and medical devices.

The potential utility of dendritic polymers both as drug delivery vectors and
25 pharmaceutical actives has received increasing interest in recent years. However, whilst the literature is replete with reports of, for example, synthetic schemes for dendrimer assembly, descriptions of dendrimer-drug interactions and drug loading efficiencies and increasingly, *in vitro* evaluations of dendrimer interactions with cell lines, there is very little information describing the fundamental pharmacokinetic and metabolic fate of

- 3 -

dendrimers.

Further, it is still a challenge to prepare dendrimers that circulate in the blood long enough to accumulate at target sites, but that can also be eliminated from the body at a reasonable rate to avoid long-term build up. In addition, the tissue localisation of dendrimers is still
5 difficult to predict in advance and more studies are required to determine the effect of peripheral dendritic groups on these properties. An additional area that needs to be investigated is the release of drugs from dendrimers. Steric hindrance associated with the dense globular dendritic architecture makes the engineering of the enzymatically cleavable linkages difficult.

10 It has surprisingly been found that, by introducing one or more functional moieties, as described herein, the efficacy of the macromolecule may be significantly improved, but without significant adverse impact on, or interference with, other functional moieties which may be present.

SUMMARY OF THE INVENTION

15 The present invention relates to dendrimers having a first functional moiety attached to the core moiety thereof and at least one second functional moiety attached to the surface of the outermost layer of building units (surface building units) of the dendrimer. In particular, the invention relates to a dendrimer comprising a core and one or more layers of lysine or lysine analogue building units wherein the dendrimer has a first functional moiety attached
20 to a nitrogen atom of the core moiety and one or more second functional moieties attached to surface amino nitrogen atoms of the outermost layer of building units.

Accordingly, in a first aspect, the present invention provides a macromolecule comprising:

- (i) a core moiety having a first amino nitrogen atom for attachment to a first functional moiety and at least two further amino nitrogen atoms for attachment
25 to lysine or lysine analogue building units;
- (ii) a first functional moiety attached to the core moiety through the first amino

- 4 -

nitrogen atom;

- (iii) at least one layer of lysine or lysine analogue building units, the outermost layer having surface amino nitrogen atoms for attachment to one or more second functional moieties, said layers attached to the core moiety through the at least two further amino nitrogen atoms of the core moiety; and
- (iv) one or more second functional moieties attached to the surface amino nitrogen atoms of the outermost layer of lysine or lysine analogue building units;

wherein

the first and second functional moieties each comprise an agent selected from the group consisting of pharmaceutically active agents, interacting agents and pharmacokinetic modifying agents.

The incorporation of a pharmaceutically active agent into a macromolecule of the invention may provide an extended release profile for the agent, or extend its plasma residence time, in use. The incorporation of a pharmacokinetic modifying agent, into such a macromolecule may further enhance the release profile of the pharmaceutically active agent, or further extend its plasma residence time, in use. The incorporation of an interacting agent, such as a targeting agent, or capture agent into a macromolecule of the invention may provide an increase in concentration of the macromolecule at target cell or tissue types, and advantageously an increased uptake of the macromolecule into target cell or tissue types, or targeting of the macromolecule to a protein, DNA or RNA target in use or a more efficient, reproducible means of attaching the macromolecule to the surface of a component of a diagnostic or medical device, in use.

In turn, two or more of the different types of functional moieties described above, may be incorporated into the macromolecule to provide a macromolecule having multiple complementary functionalities.

The second functional moiety may be the same or different to the first. A second

- 5 -

functional moiety may be attached to only one, some, or all of the surface amino nitrogen atoms. The macromolecule may contain only first and second functional moieties or may include, one or more third (and optionally fourth and fifth), functional moieties as defined herein which may be optionally attached to surface amino groups to provide a
5 macromolecule with a first functional moiety at the core and at least one of each of second and third (and optionally fourth and fifth), functional moieties on the surface of the macromolecule. The third (and optionally fourth and fifth) functional moieties may be selected from pharmaceutically active agents, pharmacokinetic modifying agents and interacting agents.

- 10 The functional moieties may be independently directly attached to the appropriate nitrogen atom, or attached *via* a cleavable or non-cleavable linker.

The macromolecules according to this aspect of the present invention are particularly suitable for the presentation of a pharmaceutically active agent. Thus, in one embodiment of the invention, at least the first and/or second functional moiety comprises a
15 pharmaceutically active agent. The macromolecule may include a single pharmaceutically active agent attached to the core and/or surface building units or a plurality of pharmaceutically active agents (which may be the same or different), on the core and/or at selected points on the surface of the macromolecule.

In a particular example of this embodiment, a pharmaceutically active agent is attached to
20 the core moiety of the macromolecule. In further examples thereof, the pharmaceutically active agent is a protein or polypeptide.

In some embodiments of the invention, at least the first and/or second functional moiety comprises a pharmacokinetic modifying agent. The macromolecule may include a single pharmacokinetic modifying agent at the core and/or the surface building units or a plurality
25 of pharmacokinetic modifying agents (which may be the same or different) at the core and/or selected points on the surface of the macromolecule.

The presentation of the macromolecule including a first functional moiety, comprising a

- 6 -

pharmaceutically active agent, and at least a second functional moiety, comprising a pharmacokinetic modifying agent, may advantageously result in improved performance of the macromolecule.

In further embodiments of the invention, there is provided a macromolecule wherein the first functional moiety comprises a targeting agent, such as an antibody, and the at least one second functional moiety comprises a pharmaceutically active agent.

In another aspect of the invention there is provided a process for preparing a macromolecule as described above, including the steps of:

(i) providing

10 (a) a dendrimer comprising:

(i) a core moiety having a first amino nitrogen atom for attachment to a first functional moiety and at least two further amino nitrogen atoms for attachment to lysine or lysine analogue building units;

15 (ii) a first protecting group at the first amino nitrogen atom;

(iii) at least one layer of lysine or lysine analogue building units, the outermost layer having surface amino nitrogen atoms for attachment to the one or more second functional moieties, said layers attached to the core moiety through the at least two further amino nitrogen atoms of the core moiety; and

20 (iv) a second protecting group at one or more of the surface amino nitrogen atoms of the outermost layer of lysine or lysine analogue building units;

(b) a first functional moiety; and

- 7 -

- (c) at least one second functional moiety;
- (ii) selectively removing the second protecting group(s) using reaction conditions to which the first protecting group is inert;
- (iii) attaching the at least one second functional moiety to the deprotected surface amino
5 nitrogen atom(s);
- (iv) removing the first protecting group;
- (v) attaching the first functional moiety to the deprotected first amino nitrogen atom or the linker group.

In a further aspect of the present invention, there is provided a pharmaceutical composition
10 including a macromolecule according to the invention and a pharmaceutically acceptable excipient, carrier or adjuvant therefor.

In yet a further aspect, the invention provides a macromolecule as described herein for use in therapy.

The macromolecule and pharmaceutical compositions containing the macromolecule
15 according to this aspect of the present invention may be utilised in various applications, as discussed herein, where the ability to direct or bind the pharmaceutically active agent to a particular site of action, or to a particular cell or tissue type, or to a protein, DNA or RNA target, or substrate or to modify the pharmacokinetics thereof.

DETAILED DESCRIPTION OF THE EMBODIMENTS

20 The reference in this specification to any prior publication (or information derived from it), or to any matter which is known, is not, and should not be taken as an acknowledgment or admission or any form of suggestion that that prior publication (or information derived from it) or known matter forms part of the common general knowledge in the field of endeavour to which this specification relates.

- 8 -

The term "antibody" as used herein in the specification and claims includes the full antibody, or a derivative or a fragment, such as that derived from enzymatic or chemical cleavage or obtained recombinantly, or a mimic of the binding region of an antibody produced either by way of protein expression techniques or through chemical synthesis, which retains the specific binding activity. The term includes monoclonal antibodies and all the various forms derived from monoclonal antibodies, including but not limited to full-length antibodies (e.g. having an intact Fc region), antigen-binding fragments, including for example, Fv, Fab, Fab' and F(ab')₂ fragments; and antibody-derived polypeptides produced using recombinant methods such as single chain antibodies. The terms "antibody" and "antibodies" as used herein also refer to human antibodies produced for example in transgenic animals or through phage display, as well as chimeric antibodies and humanized antibodies.

The term "attached" as used herein in the specification and claims refers to a connection between chemical components of the macromolecule by way of covalent bonding, hydrogen bonding, adsorption, metallic bonding, Van der Waals forces, ionic bonding, chelate-metal-chelate linkages, a ligand-receptor linkages, duplexes or triplexes formed from complimentary strands of DNA, RNA or peptide analogues thereof, or any combination thereof. A particular form contemplated herein is covalent bonding. The attachment may be direct, or indirect through an intervening moiety or moieties, such as a bridge, spacer, or linker moiety or moieties, which terms may be used interchangeably herein. Furthermore, a linker group or functional moiety or amine may be further modified by a modifier to facilitate the attachment.

The term "selected point of attachment" as used herein in the specification and claims refers to an amine group or amine groups of the dendrimer polymer that are differentiated from other amine groups of the dendrimer polymer in being uniquely reactable at a defined stage in the synthesis of the dendrimer polymer, thereby allowing the attachment of a functional moiety or dendritic motif. This advantageously allows the surface position and distribution of a functional moiety to be known. The selected point of attachment may therefore be at the first nitrogen atom of the core moiety or on the surface of the

- 9 -

dendrimer.

The term "binding" as used herein in the specification and claims refers to the ability of a given molecule to be captured (bound) and held by another, for example a ligand to interact with a target such that the interaction between the ligand and its target is relatively
5 specific. Examples include the specific interaction between an antibody, or derivatives and fragments thereof and the antibody target (receptor); or the interaction between a small molecule, such as biotin, folate or digoxin, and their respective targets (receptors or antibodies).

The term "derivatives" and "fragments" as used herein in the specification and claims, and
10 when used in relation to polypeptides, particularly antibodies refers to functional equivalents having similar amino acid sequence, say at least 80, 85, 90, or 95% homology, and retaining, at least to some extent, the activities of the polypeptide.

The term "lysine analogue" as used herein in the specification and claims refers to a molecule which has a single apex carboxyl group and two or three primary amine groups.
15 In one instance they may be asymmetric, as for the parent Lysine 1 and this is defined as meaning that the bonds and atoms that join the primary amines to the carboxylate apex are different. In a second instance lysine analogues may be symmetrical which is defined to mean that the bonds and atoms that join each primary amine to the carboxylate are identical, and which disregards the asymmetry that is potentially introduced when each
20 primary amine is further reacted.

The term "dendritic motif" as used herein in the specification and claims refers to a discrete unit of the macromolecule. When one of the macromolecule branches is cut at the bond which connects one of the reactable amines of the building unit or core to the apex carboxylate group of the attached building unit, the dendritic motif will "fall out". The
25 apex carboxylate group of the dendritic motif represents the point at which the dendritic motif would be attached to a growing macromolecule core during the process of synthesising a macromolecule of the invention.

- 10 -

The term "building unit" as used herein in the specification and claims refers to lysine or lysine analogues used in the assembly of dendritic motifs. The building unit may be a subsurface building unit, being part of the layer, or generation, of building units bearing amines that may be further reacted with the apex carboxylate group of a further building unit. The layers may in turn be described as the surface-but-one layer, meaning the first subsurface immediately adjacent the surface layer; the surface-but-two layer is the second layer below the surface layer; the surface-but-three layer is the third layer below the surface layer; and so on.

As used herein, the term "layer" or "generation" refers to a plurality of building units having the same degree of connectivity to the core moiety, i.e. having the same number of building units linking the building unit in question to the amino nitrogen atoms of the core. For example, building units which are attached, either directly or *via* a linker group, to the nitrogen atoms of the core moiety are referred to the first layer or generation. Building units which have one building unit between them and the nitrogen atoms of the core moiety are referred to as the second layer or generation. A layer or generation of building units must contain at least two building units. Each layer of building units is homogenous with regard to the building unit used, however, different building units may be used to prepare different layers. Thus in certain embodiments of the invention, the macromolecule is composed of one or more layers of a single type of building unit, e.g. lysine. In other embodiments, the macromolecule comprises at least two layers of building units wherein at least two layers are composed of different building units.

The term "small molecule" refers to any non-peptide molecule which has a molecular weight of up to about 1500 Daltons, such as from about 200 to about 600, or from about 600 to about 1000 or from about 1000 to about 1500 Daltons.

The term "surface" as used herein, is used in reference to the outermost layer of building units of the dendrimer.

The term "surface building unit" as used herein in the specification and claims refers to the outermost layer of building units of the macromolecule. i.e. there are no further building

- 11 -

units attached to the surface amines of a surface building unit.

The term "surface amine" or "surface amino" or "surface amino nitrogen atom" as used herein in the specification and claims refers to any of the outer-most nitrogens of the dendritic motif which derive from surface building units. These surface amines represent
5 the points of attachment for additional building units, linkers or functional moieties.

The term "functional moiety" as used herein in the specification and claims refers to any group, as defined herein, that may be attached, either directly or indirectly, at a first amino nitrogen of the core or a surface amine with the purpose of serving the stated function. The nature and number of functional moieties may be determined by standard analytical
10 techniques including proton/carbon NMR, ESI or MALDI mass spectrometry.

The term "amine-protecting groups", as used herein in the specification and claims refers to groups for which an order of removal exists such that those groups that are not meant for cleavage are inert to the cleavage conditions. When protecting groups are defined as "resolvable", this means that the conditions for removal of one group may affect the
15 integrity of the second group and this requires that the second group be removed first if the integrity of the first group is to be maintained. When protecting groups are further defined as "orthogonal", this means that each group is inert to the cleavage conditions required to remove each of the other groups of the orthogonal set. It is important to note that protecting groups are resolvable or orthogonal only when the appropriate reaction
20 conditions are used. There are general methods described in the art for the selective mono-protection of polyamine molecules. Such methods are described in Krapcho and Kuell *Synthetic Commun.* (1990) 20:2559.

The macromolecules of the present invention are constructed from at least one layer of lysine or lysine analogue building units. Examples of building units contemplated by the
25 invention include the following (where # depicts the carbonyl residue of the apex carboxyl group):

- 12 -

Lysine* 1 having the structure:

Glycyl-Lysine* 2 having the structure:

- 5 Analogue 3, having the structure below, where a is an integer 1 or 2; and b and c are independently integers 1, 2, 3 or 4

Analogue 4, having the structure below, where a is an integer 0, 1 or 2; and b and c are independently integers 2, 3, 4, 5 or 6

Analogue* 5, having the structure below, where a is an integer 0, 1, 2, 3, 4 or 5; and b and c are independently integers 1, 2, 3, 4 or 5

- 13 -

Analogue 6, having the structure below, where a is an integer 0, 1, 2, 3, 4 or 5; and b and c are independently integers 0, 1, 2, 3, 4 or 5

Analogue 7, having the structure below, where a is an integer 0, 1, 2, 3, 4 or 5; and b and c are independently integers 1, 2, 3, 4 or 5

Analogue 8, having the structure below, where a is an integer 0, 1, 2, 3, 4 or 5; and b, c and d are independently integers 1, 2, 3, 4 or 5

- 14 -

Analogue **9**, having the structure below, where a is an integer 0, 1, 2, 3, 4 or 5; and b and c are independently integers 1, 2, 3, 4 or 5

Furthermore, any methylene group of the building units may be replaced by a methyleneoxy (CH₂-O) or ethyleneoxy (CH₂-CH₂-O) group, provided that this does not result in the formation of a carbonate (-O-C(O)-O-) or carbamate (-O-C(O)-N-) moiety within the building unit.

In certain embodiments of the invention, the building units are selected from Lysine **1**, Glycyl-Lysine **2** or Lysine analogue **5**:

10

5

where a is an integer 0, 1 or 2 and further, any methylene group of **1**, **2** or **5** may be replaced by a methyleneoxy or ethyleneoxy group provided that this does not result in the formation of a carbonate or carbamate moiety within the building unit.

Both the carboxylate group and the amine groups of the building units may be derivatised to enhance or diminish the reactivity of these groups. Reactable amine groups may be protected (deactivated) using amine-protecting groups such as Boc, CBz, 4-nitrobenzyloxycarbamate (4-NO₂-CBz) Fmoc, Dde, CF₃CO₂, 2-halo-CBz, Alloc, Me₃SiEtSO₂, Troc, o-NO₂-PhSO₂ and 2,4-dinitrobenzene-sulfonyl groups.

- 15 -

In general, a free carboxyl group is not sufficiently reactive to react with an amine to form the amide bond, so some means is preferably provided that facilitates the dehydration and so drives the reaction to completion. This may be achieved, for example, by "activating" the carboxyl group as an acyl halide derivative or an activated ester derivative (The
5 Peptides, Analysis, Synthesis and Biology Vol 1 Major Methods of Peptide Bond Formation; Academic Press New York 1979 eds Gross, E. and Meienhofer, J., Peptides: Chemistry and Biology. Wiley-VCH Weinheim 2002, Sewald, N. and Jakubke, H-D., The Chemical Synthesis of Peptides Clarendon Press, Oxford 1994, Jones, J.).

In the first activation method, the reagent which contains the carboxylic acid is reacted
10 with a second reagent containing a hydroxyl moiety in the presence of a dehydrating reagent and, where required, other activating agents, to provide a product in which the acid containing moiety and the hydroxyl containing moiety are joined by an ester bond. This product is known as an "active ester". The reagent containing the hydroxyl moiety is chosen such that the product ester will readily react with primary amines to form amides
15 with liberation of the aforementioned reagent containing the hydroxyl moiety. In some cases, the active ester is sufficiently stable to enable it to be isolated, purified and stored prior to use.

In a second activation method, the reagent which contains the carboxyl group may be reacted "*in situ*" with an activating agent to form an acyl species which further reacts with
20 primary amines also present "*in situ*" or added after an appropriate prior activation time to lead to the formation of the required amide bond.

Both activation methods are described in more detail in PCT/AU2006/001591.

The lysine or lysine analogue building units of the dendritic motifs are reacted with a core compound. A core may be any compound containing three or more reactive (amino)
25 nitrogens, one of which ultimately becomes the point of attachment for the first functional moiety (first amino nitrogen atom). It will be understood that this nitrogen atom can be protected by an appropriate protection group during construction of the dendrimer.

- 16 -

In certain embodiments of the invention, the core can be prepared by reacting one nitrogen atom of a diamino compound with lysine or a lysine analogue to form a triamino core compound. The unreacted amino group of the diamino compound can then become the amino group for attachment of the first functional moiety while the at least two amino groups of the lysine or lysine analogue become the points of attachment for the building units.

Diamino compounds suitable for reaction with lysine or lysine analogues, such as those exemplified herein, to prepare the core moieties include:

10 where a is an integer of 1 to 9, for example 1, 2, 3, 4 or 5;

where a, b and c, are independently integers 1, 2, 3, 4 or 5, such as 2 or 3; and d is an integer from 0-100, such as 1-30; particularly 1-5, 6-10, 11-15, 16-20, 21-25 or 26-30;

15 where a and b, are independently integers 0, 1, 2, 3, 4 or 5;

- 17 -

where a and c, are independently integers 1, 2, 3, 4, 5 or 6 and where c is an integer from 0, 1, 2, 3, 4, 5 or 6;

where a and d, are independently integers 1, 2, 3, 4, 5 or 6 and where b and c, are independently integers 0, 1, 2, 3, 4, 5 or 6.

Triamino compounds may be employed without further modification (i.e. reaction with lysine or a lysine analogue), or may be reacted with a lysine or lysine analogue to form a tetraamino core.

Examples of triamino compounds include:

where a, b and c, are independently integers 1, 2, 3, 4, 5 or 6;

- 18 -

where a, b and c, are independently integers 0, 1, 2, 3, 4, 5 or 6;

5 where a, b and c, are independently integers 0, 1, 2, 3, 4, 5 or 6;

- 19 -

where a, b and c, are independently integers 0, 1, 2, 3, 4, 5 or 6; and d, e and f, are independently integers 1, 2, 3, 4, 5 or 6.

Tetramino compounds may be employed without further modification (i.e. reaction with
 5 lysine or a lysine analogue) or may be reacted with lysine or a lysine analogue to form a pentamino core. Examples of tetramino compounds include:

- 20 -

where a, b, c and d, are independently integers 0, 1, 2, 3, 4, 5 or 6

where a, b, c and d, are independently integers 1, 2, 3, 4, 5 or 6

- 5 where a, b, c and d, are independently integers 0, 1, 2, 3, 4, 5 or 6; and e, f, g and h, are independently integers 1, 2, 3, 4, 5 or 6.

Furthermore, any methylene group of the core may be replaced by a methyleneoxy or ethyleneoxy group provided that this does not result in the formation of a carbonate or carbamate moiety within the core.

- 10 In certain embodiments, the core is a triamino compound resulting from reaction of lysine, or a lysine analogue, and a diamino compound selected from the following:

- 21 -

where a is an integer 1, 2, 3, 4 or 5;

where a, b and c, are independently integers of 2 or 3 and d is an integer from 1-30;

where a and d, are independently integers of 1 or 2 and where b and c, are independently integers from 0, 1 or 2.

In particular examples, the core is made up of a diamino compound, such as compound **11** where each of a, b, c and d are 1 (NEOEOEN) and lysine or a lysine analogue, for example, analogue **5**, where each of a, b and c are 2 (Su(NPN)₂).

In other embodiments, the core is a triamino or tetramino compound selected from the following, either alone or as a reaction product with lysine or a lysine analogue:

- 22 -

where a, b and c, which may be the same or different, are integers of 1 to 2;

**20**

where a, b and c, are independently integers 0, 1 or 2; and d, e and f, are independently integers 1 or 2.

5

or a tetramine compound

**21**

where a, b, c and d, are independently integers 0 or 1

- 23 -

where a, b, c and d, are independently integers 1 or 2;

where a, b, c and d, are independently integers 0, 1 or 2; and e, f, g and h, are
 5 independently integers 1 or 2.

The preparation of lysine and lysine analogue dendrimer polymers is well known and is described by way of example in US Patent Nos. 4,289,872 and 4,410,688.

In general, the dendrimer has a core which retains a single reactive site that is preserved (by an appropriate protecting group) whilst the remaining amino sites of the core are
 10 utilised for the addition of building units. The protected reactive site of the core is ultimately used to attach a single entity (first functional moiety) to the core of the macromolecule.

- 24 -

In constructing the dendrimer, it is possible, through the use of amine-protecting groups, to only further react some of the surface amine groups of the building units in a layer or generation, for example by reacting only one of two available amino groups on a building unit, or only one or two of three available amino groups on a building unit, or alternatively,
5 reacting all amino groups on only some of the surface building units, for example every second or third building unit, or two out of three building units. However, in certain embodiments of the invention, each amino group of a building unit in a particular layer or generation is further reacted with a lysine or lysine analogue building unit until the desired number of layers or generations has been constructed. In this manner, for example, when
10 using building units which have two amino groups, the number of building units in a layer is double that of the immediate sub-layer and when using building units which have three amino groups, the number of building units in a layer is three times that of the immediate sub-layer.

The functional moieties comprise residues of a pharmaceutically active agent, a
15 pharmacokinetic modifying agent, or an interacting agent, such as a targeting agent or a capture agent. The first and second functional moieties may be the same or different, and optionally the surface of the dendrimer may also carry one or more different additional functional moieties, e.g. third, fourth or fifth functional moieties. A functional moiety may be the residue of a single type of agent, e.g. pharmaceutically active agent, or may
20 comprise two agents as a single entity, e.g. two pharmaceutically active agents attached or linked together or a pharmaceutically active agent attached or linked to a pharmacokinetic modifying agent or a pharmaceutically active agent attached or linked to a targeting agent. A functional moiety, when referred to as, for example, a second functional moiety, is taken to refer to a single type of functional moiety, e.g. each of the more than one second
25 functional moieties are the same.

In some embodiments of the invention, a single type, or two three or four types of functional moiety are attached to all of the surface amino groups. In other embodiments only a portion of surface amino groups, for example those of alternating building units or one out of two surface groups per building unit or 1 or two out of three surface groups per

- 25 -

building unit, have a functional moiety attached.

- As used herein, a pharmaceutically active agent includes any molecule or precursor thereof, or residue thereof, which is capable of imparting a physiological effect or reaction after administration to a subject, either alone or in conjunction with another pharmaceutically active agent. The term also encompasses agents or residues thereof which in themselves may not impart a physiological effect or the desired level thereof, but in conjunction with one or more other pharmaceutical agents, or when attached to the dendrimer, provides the desired physiological activity. Pharmaceutically active agents contemplated herein may be naturally occurring, including modifications and derivatives of naturally occurring molecules, or may be synthetic and examples contemplated herein include small molecules, polymers, (non-dendritic and dendritic, where the dendritic moiety can have the same number of generations or a different number of generations to the macromolecule), saccharides, oligosaccharides, polysaccharides, amino acids, peptides, oligopeptides, polypeptides, proteins, glycoproteins, nucleic acids and nucleotides.
- Particular pharmaceutically active agents contemplated are intended for therapeutic or prophylactic applications. Examples of physiological effects or reactivity imparted by pharmaceutically active agents include depressing or stimulating biological reactions, for example through binding to a substrate, replacement or addition of substances, removal of deleterious substances and cellular death.
- Protein-based drugs have been developed that provide significant clinical benefit to the patient, but in many cases these drugs require frequent dosing and large dose sizes. This is because the physio-chemical properties of the protein drugs lead to their rapid renal excretion or metabolic clearance. Advantageously, when attached to a dendrimer as described herein, the pharmacokinetic properties of the protein may be beneficially altered.
- Thus, in certain examples of the invention, the pharmaceutically active agent(s) of the macromolecule may be amino acid based such as a protein, a glycoprotein, a peptide, oligopeptide, polypeptide or an enzyme or derivatives thereof.

The enzymes may be selected from carbohydrate specific enzymes, proteolytic enzymes,

- 26 -

oxidoreductases, transferases, hydrolases, lyases, isomerases and ligases. Examples of enzymes include asparaginase, arginase, arginine deaminase, adenosine deaminase, superoxide dismutase, endotoxinases, catalases, chymotrypsin, lipases, uricases, adenosine diphosphatase, tyrosinases, and bilirubin oxidase. Carbohydrate-specific enzymes of
5 interest include glucose oxidases, glycosidases, glucocerebrosidases, glucuronidases, etc.

Peptides and proteins that do not contain glycan moieties may be glycosylated either enzymatically using glycosyltransferases, or chemically synthesised, for example by using standard peptide chemistry and glycosylated amino acid components such as N-galactosylated asparagine. Alternatively glycosylation sites may be engineered into
10 proteins or peptides which *in vivo* normally are produced in their non-glycosylated form.

Examples of proteins and peptides include haemoglobin, serum proteins such as blood factors including Factors VII, FX, FII, FV, protein C, protein S, tPA, PAI-1, tissue factor, FXI, FXII, and FXIII, as well as sequence FVIII, FIX variants thereof; immunoglobulins, cytokines such as interleukins, alpha-, beta-, and gamma-interferons, colony stimulating
15 factors including granulocyte colony stimulating factors, platelet derived growth factors and phospholipase-activating protein (PUP). Other proteins and peptides include insulin, plant proteins such as lectins and ricins, tumor necrosis factors and related alleles, soluble forms of tumor necrosis factor receptors, interleukin receptors and soluble forms of interleukin receptors, growth factors such as tissue growth factors, such as TGFa's or
20 TGFps and epidermal growth factors, hormones, somatomedins, erythropoietin, pigmentary hormones, hypothalamic releasing factors, antidiuretic hormones, prolactin, chorionic gonadotropin, follicle-stimulating hormone, thyroid-stimulating hormone, tissue plasminogen activator, and the like. Immunoglobulins of interest include IgG, IgE, IgM, IgA, IgD and fragments thereof.

25 The pharmaceutically active agent of the macromolecule may alternatively, or in addition, include a water-insoluble pharmaceutical, a water-soluble pharmaceutical, a lipophilic pharmaceutical, or mixtures thereof.

- 27 -

The pharmaceutically active agent may be exemplified by, but not limited to one or more types selected from the groups in Table 1.

Table 1 Pharmaceutically active agents

Acetonemia preparations	Anabolic agents
Anaesthetics	Analgesics
Anti-acid agents	Anti-arthritic agents
Antibodies	Anti-convulsants
Anti-fungals	Anti-histamines
Anti-infectives	Anti-inflammatorys
Anti-metabolites	Anti-microbials
Anti-mitotics	Anti-parasitic agents
Anti-protozoals	Anti-ulcer agents
Antiviral pharmaceuticals	Behaviour modification drugs
Biologicals	Blood and blood substitutes
Bronchodilators and expectorants	Cancer therapy and related pharmaceuticals
Cardiovascular pharmaceuticals	Central nervous system pharmaceuticals
Diuretics	Contraceptives
Growth hormones	Diabetes therapies
Hematinics	Fertility pharmaceuticals
Hormone replacement therapies	Growth promoters
Immune suppressives	Hemostatics
Hormones and analogs	Immunostimulants
Minerals	Muscle relaxants
Nutraceuticals and nutritionals	Natural products
Ophthalmic pharmaceuticals	Obesity therapeutics
Pain therapeutics	Osteoporosis drugs
Proteins	Peptides and polypeptides
Retinoids	Respiratory pharmaceuticals
Sedatives and tranquilizers	Transplantation products
Urinary acidifiers	Steroids
Vitamins	Vaccines and adjuvants

5 The present invention is particularly appropriate for pharmaceuticals that are very active

- 28 -

even in extremely small quantities and whose sustained long-term administration is sought, particularly to overcome toxicity problems with standard doses. Non-limiting examples include paclitaxel and doxorubicin.

5 The macromolecules according to the present invention may be particularly useful in facilitating the passive targeting of drugs to sites of inflammation. This targeting is possible because of the increased permeability of vasculature associated with inflammation, to macromolecules and because of limited lymphatic drainage. Accordingly, in certain embodiments, the pharmaceutically active agent is an anti-inflammatory agent.

10 In one embodiment, the macromolecule according to the present invention includes two or more different pharmaceutically active agents, derivatives thereof, precursors thereof, or residues thereof, as functional moieties, either as separate moieties, or together in a single entity. The macromolecules according to this aspect of the present invention may therefore have application in combination therapy.

15 The pharmaceutically active agent may be an anti-tumor agent selected from one or more of the following:

20 rituximab, oxaliplatin, docetaxel, gemcitabine, trastuzumab, irinotecan, paclitaxel, bevacizumab, carboplatin, cetuximab, doxorubicin, pemetrexed, epirubicin, bortezomib, topotecan, azacitidine, vinorelbine, mitoxantrone, fludarabine, doxorubicin, alemtuzumab, carmustine, ifosfamide, idarubicin, mitomycin, fluorouracil, cisplatin, methotrexate, melphalan, arsenic, denileukin diftitox, cytarabine, calcium levofolinate, cyclophosphamide, etoposide, viscum album, mesna, gemtuzumab, ozogamicin, busulfan, pentostatin, cladribine, bleomycin, daunorubicin, bendamustine, dacarbazine, raltitrexed, vincristine, fotemustine, etoposide phosphate, porfimer sodium and vinblastine.

25 The pharmaceutically active agents may be a combination of any two or more of the categories exemplified in Table 1 and/or anti-tumour agents listed above, either as a single entity where appropriate, or as separate functional moieties.

- 29 -

Exemplary combinations include, but are not limited to, combinations of:
chemotherapeutic pharmaceuticals; anti-inflammatory pharmaceuticals and anti-arthritis
pharmaceuticals; obesity therapeutics and diabetes therapeutics; growth hormones and
growth promoters; muscle relaxants and anti-inflammatories; respiratory pharmaceuticals
5 and bronchodilators or anti-microbials; chemotherapeutics and vitamins and the like.

Another group of pharmaceutically active agents contemplated herein are molecules or
residues thereof which in themselves may not necessarily provide any desired or
meaningful physiological activity but when attached to the surface or core of the dendrimer
or when administered in combination (either separately, sequentially, or as an intimate
10 composition) with one or more other pharmaceutically active agents, impart a
physiological effect.

International Patent Application No. PCT/AU95/00350 (WO 95/34595) (the contents of
which are incorporated herein by reference) describes a class of antiviral compounds
comprising a dendrimer polymer having a plurality of surface groups, wherein at least one
15 of the surface groups has an anionic- or cationic-containing moiety (or terminal group)
bonded or linked thereto, particularly a sulfonic acid-containing, a carboxylic acid-
containing, or a trimethylammonium-containing moiety. International Patent Application
No. PCT/AU97/00447 (WO 98/03573) (the contents of which are incorporated herein by
reference) describes the use of anionic- or cationic-containing dendrimer polymers in the
20 prophylactic or therapeutic inhibition of angiogenesis in a human or non-human animal
patient. The anionic- or cationic-containing moiety (or terminal group), which is linked or
bonded to the surface groups of the dendrimer polymer include sulfonic acid-containing
moieties, carboxylic acid-containing moieties, phosphoric or phosphonic acid-containing
moieties, boronic acid-containing moieties, neuraminic or sialic acid-containing moieties
25 or moieties containing neuraminic or sialic acid modified in the 4- or other position
thereof.

Such anionic or cationic moieties (and their pharmaceutically acceptable salts) are
contemplated herein as examples of pharmaceutically active agents. Two particular
examples of such agents include $\text{-CO-3,5-Ph(SO}_3\text{Na)}_2$, $\text{COCH}_2\text{O-3,6-Naph(SO}_3\text{Na)}_2$.

- 30 -

In some examples of the invention, the first functional moiety comprises a pharmaceutically active agent. In other examples, the second functional moiety comprises a pharmaceutically active agent. In yet further examples, the first functional moiety comprises a pharmaceutically active agent and the second functional moiety comprises a different pharmaceutically active agent. In yet other examples, the second and third functional moieties comprise pharmaceutically active agents.

A pharmacokinetic modifying agent includes any molecule or residue thereof which can modify or modulate the pharmacokinetic profile of a pharmaceutically active agent or the dendrimer bearing the pharmaceutically active agent, including that of absorption, distribution, metabolism and/or excretion. In a particular embodiment, the pharmacokinetic modifying agent is selected to prolong the plasma half-life of the pharmaceutically active agent or macromolecule.

In certain embodiments of the invention, at least one functional moiety is a pharmaceutically active agent and another functional moiety is a pharmacokinetic moiety.

The pharmacokinetic modifying agent may include polyfluorohydrocarbons, fatty acids, lipids, oligo- and poly-saccharides, deoxycholic acids (bile acids) or a polyethylene glycol (PEG), or polypropyleneglycol, and alkyl capped forms thereof, or polyethyloxazoline (e.g. PEOX) motif.

It is envisaged that the macromolecules of the invention will be particularly useful when the pharmaceutically active agent (such as a polypeptide or small molecule drug) is presented in combination with at least one pharmacokinetic modifying agent such as a PEG group. In one embodiment, a PEG molecule may be attached to the core, and the second functional moiety is a small molecule drug or polypeptide presented on the remaining surface of the macromolecule. Optionally, the second functional moiety may be a combination of small molecule drug and a further pharmacokinetic modifier moiety, either as a single functional moiety or discrete functional moieties.

The PEG groups may include relatively short ethylene glycol chains, for example PEG

- 31 -

groups including one or more of the following

- Alternatively the second functional moiety may include a poly-glutamic acid type structure. Poly-glutamic acid groups are preferred as they are generally well tolerated *in vivo* and are water soluble.

The percentage of PEG, polyethyloxazoline groups or polyglutamic acid groups and/or the size of the PEG, polyglutamic acid or polyethyloxazoline group may be modified and tailored to suit different pharmaceutically active agents.

- 10 Previous studies have suggested that after intravenous administration, uncapped ³H labelled poly-L-lysine macromolecules are rapidly metabolised to free lysine. However, it has surprisingly been established that PEGylation of the macromolecule reduces the recognition of the dendrimer by proteolytic enzymes as well as serum proteins and suppresses the phagocytic clearance, thereby prolonging plasma circulation times.
- 15 Furthermore, PEGylation may increase the hydrodynamic volume of the macromolecule, thereby reducing the renal clearance rate.

- For example, the present inventors have found that the plasma half-life and extent of urinary elimination of ³H labelled PEGylated lysine macromolecules is dependent on molecular weight. Larger PEGylated macromolecules (i.e. >30kD) were relatively slowly
- 20 cleared from the plasma into the urine compared with smaller dendrimers (i.e. <20kD). This is despite the fact that the smaller macromolecule complexes showed signs of interaction with plasma components, leading to the creation of a higher molecular weight species. Elimination of these complexes was rapid and only intact macromolecule was

- 32 -

recovered in the urine. It is therefore apparent that adding size by any means does not necessarily result in prolonged plasma life of the macromolecules. The larger macromolecules were found to accumulate in the liver and spleen. However this occurred over extended time periods and the amount that accumulated was less than 10 % of the
5 dose.

In a further preferred embodiment, wherein a first functional moiety is attached to the macromolecule, the PEG or PEOX, as second functional moieties, may constitute differing amounts relative to the first. Preferably the ratios of PEG or PEOX moieties to other functional moieties is in the range of 128:1 to 2:1, such as 64:1 to 4:1, and particularly 32:1
10 to 8:1.

In an embodiment wherein the PEG or PEOX functional moieties are attached at a selected point of attachment, the ratios of PEG or PEOX moieties to other functional moieties is preferably in the range of 1:2 to 1:128, more preferably 1:4 to 1:64, and most preferably 1:8 to 1:32.

15 The relative size of the individual PEG or PEOX groups may be reduced to reduce or eliminate interference with the pharmaceutically active agent.

In a preferred embodiment, the PEG groups are relatively monodisperse and chosen from a molecular weight range between 200 and 10,000 Daltons, more preferably the PEG groups are chosen from a molecular weight range between 300 and 5000 Daltons, and most
20 preferably a molecular weight range between 500 and 3500 Dalton.

PEGylation may also improve the solubility of compounds and therefore may assist the solubility of an otherwise insoluble drug attached to the surface of the macromolecule.

Furthermore a pharmacokinetic modifying moiety may be incorporated in the macromolecule, to reduce non-specific binding. This may either be through an interacting
25 moiety which increases the specificity of binding of a candidate to the moiety, or a moiety that is commonly referred to as having "anti-fouling" properties in that it minimises unwanted or non-specific binding. PEG is one such moiety, as has been herein described,

- 33 -

which can, for example, decrease the recognition of the macromolecule by non-specific serum proteins.

The present invention thus provides a means by which drugs with high toxicity, or poor solubility, or both, may be engineered to provide a vehicle that will provide a controlled
5 release of the drug to maintain a long term drug concentration at therapeutic, but not toxic, plasma levels.

The macromolecules according to the present invention may advantageously contain one or more functional moieties which can selectively interact, such as by binding or other association, with other molecules ("interacting"). The presence of such a functional moiety
10 may therefore allow the macromolecule to be targeted or concentrated to a particular cell type or tissue type or to a protein (e.g. a receptor or enzyme), polysaccharide or DNA or RNA target, either *in vivo* or *in vitro*, or captured by another molecule to facilitate attachment of the macromolecule to a surface. Particular examples include lectins and antibodies and other ligands (including small molecules) for cell surface receptors. The
15 interaction may occur through any type of bonding or association including covalent, ionic and hydrogen bonding, Van der Waals forces.

In one embodiment, the interacting agent is a peptide or polypeptide antibody. Advantageously, through its selective binding with its substrate, the antibody preferentially directs or concentrates the macromolecule to an appropriate *in vivo* or *in vitro* target, such
20 as a cell surface receptor or polysaccharide, by binding to said target. Such a binding antibody is further referred to herein as "targeting agent".

In another embodiment, the interacting functional moiety is a non-peptide small molecule. Advantageously, the small molecule preferentially directs or concentrates the macromolecule to an appropriate *in vivo* or *in vitro* target, such as a receptor, or other
25 small molecule, by interacting with said target. Such a small molecule is further referred to herein as a "capture agent".

The present invention is particularly appropriate for targeting of pharmaceutically active

- 34 -

agents wherein the pharmaceutically active agent is a small drug molecule. Accordingly, in one embodiment, an interacting moiety may be attached to the core through the first amino nitrogen atom and the second functional moiety is a small molecule drug presented on the surface of the macromolecule. Optionally, the second functional moiety may be a
5 combination of small molecule drug and a moiety that modified the pharmacokinetics of the small molecule drug and/or macromolecule, such as PEG, PEOX or poly-glutamic acid, either as discrete functional moieties, or a combined single type of functional moiety.

A number of different cell surface receptors are useful as targets for the binding and, preferably, enhanced uptake of macromolecules. In particular, receptors and their related
10 ligands that are useful in the present invention include, but are not limited to, the folate receptor, adrenergic receptor, growth hormone receptor, luteinizing hormone receptor, estrogen receptor, epidermal growth factor receptor, fibroblast growth factor receptor (eg FGFR2), IL-2 receptor, CFTR and vascular epithelial growth factor (VEGF) receptor.

Folate is a vitamin that is essential for the biosynthesis of nucleotide bases and is therefore
15 required in high amounts in proliferating cells. In cancer cells, this increased requirement for folic acid is frequently reflected in an overexpression of the folate receptor which is responsible for the transport of folate across the cell membrane. In contrast, the uptake of folate into normal cells is facilitated by the reduced folate carrier, rather than the folate receptor. The folate receptor is upregulated in many human cancers, including
20 malignancies of the ovary, brain, kidney, breast, myeloid cells and the lung and the density of folate receptors on the cell surface appears to increase as the cancer develops.

The relative specificity of the folate receptor to tumour cells, and in particular to advanced stage tumour cells, mean that the folate receptor ligand, folate, may be a useful candidate for targeting chemotherapeutic drugs to tumours. The specificity of the folate receptor
25 interaction with a folate receptor ligand-chemotherapeutic drug conjugate is further enhanced by the difference in the cell surface expression pattern of the folate receptor between certain non-transformed and malignantly transformed epithelial cells. In non-transformed cells, the folate receptor is preferentially expressed on the apical membrane surface of the cells, which faces the body cavity and is inaccessible to reagents present in

- 35 -

the blood. However, upon transformation, the cell loses its polarity and the receptor can become accessible to drugs in the circulatory system that are targeted to the folate receptor. Accordingly, folate or a folate derivative may be a useful binding (capture) moiety of the macromolecule of the present invention.

- 5 In some embodiments of the invention, the interacting moiety is a peptide or polypeptide in the form of an antibody (targeting agent), and is synthesised to have multiple adjacent histidine residues (poly-histidine motif) at either the N or C terminus, a cysteine tag, or a combination thereof, to facilitate the reaction with the deprotected dendrimer.

10 Targeting peptides and antibodies may be expressed fused to an N or C terminal, preferably N terminal, poly-histidine motif. The terminal poly-histidine motif may be utilised to conjugate the targeting peptide to the dendrimer of the contrast agent of the invention through a Nickel complex, wherein the Nickel ions are present as surface groups on the dendrimer or on the ends of linkers extending from the dendrimer, in complex with nitrilotriacetic acid moieties. Alternatively, the poly-histidine motif may be utilised for
15 one-step purification using Nickel affinity resins and optionally removed from the purified molecule by the inclusion of an enterokinase or endopeptidase cleavage recognition site. Such purification methods will be known to the skilled person.

More preferably the targeting polypeptide or antibody may be expressed fused to a N or C terminal, preferably N terminal, cysteine tail. Cysteine contains a highly nucleophilic thiol
20 group which may be utilised in the presence of thiol-specific reactive groups, such as chloro, bromo or iodoacetamide groups or the maleimide moiety to form a thioether linkage; or in disulfide exchange reactions with reactive disulfide moieties such as the 2-pyridinedithio moiety to form disulfide bonds; in either case leading to the ligation of the targeting polypeptide or antibody to the dendrimer. These thiol reactive groups would be
25 provided in the dendrimer material through reaction of appropriate derivatising agents such as activated haloacetic acids or maleimide derivatives of glycine or 3-aminopropionic acid, or activated 3-(2-pyridinedithio)propionic acid, with one or more selectively deprotected surface amines of the macromolecule.

- 36 -

The targeting polypeptide or antibody may also be expressed with a combination of cysteine and histidine tails. The cysteine and histidine tail may either be expressed, each at the opposite end to the other, (e.g. N terminal cysteine tail and a C terminal histidine tail), or both at the N or C terminal.

- 5 The macromolecule may further be utilised in various applications to modify the surface of a device where the ability of the modified device to capture or bind a particular molecule, cell or tissue type, or a protein, DNA or RNA target, or to modify the non-specific biological interactions thereof, is advantageous. The presentation of an appropriate interacting agent may provide a more efficient, reproducible means of attaching the
- 10 macromolecule to the surface of a component of a diagnostic or medical device, in use. In turn, the component of the device will have more reproducible properties because of the defined and controlled nature of macromolecule.

The interacting agent may be one of: a reactive chemical moiety, a chelate for a transition metal or a ligand partner of a high affinity ligand-receptor pair, exemplified by biotin-

15 streptavidin or digoxin-"Anti-digoxin Antibody" (Mudgett-Hunter M, Margolies M N, Ju A, Haber E. *J Immunol.* 1982;129:1165-1172).

Exemplary dendrimers and macromolecules contemplated herein may be conveniently represented according to the following formula:

20
$$[\text{First Functional Moiety}] \text{ Core } [\text{Building Unit}]_m [\text{Second Functional Moiety}]_p [\text{Third Functional Moiety}]_q$$

wherein:

the core, building units and functional moieties are as described herein;

m represents the sum of the building units (including the subsurface and surface layers) of the macromolecule. By way of example, where each layer comprises

25 building units having 2 amino groups, m is an integer between 2 and 32, for example 2, 4, 8, 16 or 32;

- 37 -

p represents the number of second functional moieties attached to amino nitrogen atoms at the surface (outermost) layer of building units. By way of example, where each layer comprises building units having 2 amino groups, p may be an integer from 1 to 64 (for example 2, 4, 8, 16, 32 or 64); and

- 5 q represents the number of third functional moieties attached to amino nitrogen atoms at the surface (outermost) layer of building units. By way of example, where each layer comprises building units having 2 amino groups, q may be an integer from 0 to 63 such that p and q is no greater than 64.

Particular combinations of functional moieties contemplated by the invention are presented
10 in the Table below:

1 st Functional Moiety	2 nd Functional Moiety	3 rd Functional Moiety
Interacting agent	Pharmaceutically active agent	-

- 38 -

As described above, the functional moieties may be attached to the macromolecule at a selected site of attachment either directly or *via* a cleavable or non-cleavable linker.

The term "linker" refers herein to any chemical entity which serves to link the functional moieties to the surface or core amino atom. Exemplary linkers contemplated by the present invention include polymers such as polyethylene glycol (PEG), polypropylene glycol, polyaryls, peptides, alkyl and alkenyl chains, and saccharides (mono, oligo and poly).

In particular embodiments, the linker comprises a PEG chain, such as from 1-100 ethyleneoxy repeat units, for example from 2-20 or 20-40 repeat units.

Long chain PEG-based groups may be utilised as linker moieties. For example, PEG-peptides may be used in a similar way to conventional peptides, except the PEG moiety provides additional *in vivo* stability and mass for the carrier. Typically, it is used to conjugate drug to antibody carriers and has the advantage of increasing the distance between antibody and drug while exposing the site of enzymatic cleavage, decrease immunogenicity of the conjugate, increase blood circulation times and increasing the solubility of the complex. Following internalisation of the conjugate and enzymatic release of the active drug (which is not necessarily released as free drug) antiproliferative effects have been observed for Adriamycin and a Duocarmycin derivative.

Where linker moieties are used to connect functional moieties to the core or surface amine of the macromolecules, the reaction between the linker and the functional moiety may be carried out either before, or after, the linker moiety is reacted with the appropriate amine of the dendrimer.

Thus, a linker may be used in a number of ways to attach a first functional moiety to the core. In a first method, the linker may be attached to the core and the first functional moiety is attached to the linker. Alternatively, the linker may be first attached to the functional moiety and then attached to the core. In a third method, both the core and the functional moiety can be attached to a linker or linker component and the two linker

- 39 -

moieties subsequently reacted together to provide the linker moiety between the core and the first functional moiety.

Similarly, a linker may be used in various ways to attach a second (or third or fourth) functional moiety to the surface of the dendrimer. The linker may be attached to the surface amino nitrogen atom of the dendrimer and the second (or third or fourth) functional moiety then attached to the linker. Alternatively, the linker may be first attached to the functional moiety, and then attached to the surface amino nitrogen atom. As above, a linker moiety or component thereof can be attached to both the surface amino nitrogen atom and the second (or third or fourth) functional moiety, and the two linkers or components subsequently reacted to provide a linker moiety between the surface and functional moiety.

In addition, linker moieties may be incorporated into the synthesis of the macromolecule according to the present invention, for example between building units. As described above, the linker may be attached to either the surface amino nitrogen atoms, the building unit forming the next layer or both, to ultimately provide a linker between building units.

A reaction which is used to introduce one or more linker moieties onto a dendrimer or dendritic motif (either at the surface or core) is conducted to ensure the complete reaction of all deprotected surface amines of a macromolecule with the linker moieties. Typically this is done by using an excess of the chosen linker moiety.

The linker may be reacted with the deprotected dendritic motif or macromolecule prior to reaction of the linker with the functional moiety. In a further embodiment, the linker attached to the macromolecule may in turn bear a protecting group that requires deprotection to enable reaction with the functional moiety.

Preferably, the amine protecting groups are selected from the group including Boc, CBz, 4-nitrobenzyloxycarbamate (4-NO₂-CBz), Fmoc, Dde, CF₃CO₂, 2-halo-CBz, Alloc, Me₃SiEtSO₂, Troc, o-NO₂-PhSO₂ and 2,4-dinitrobenzene-sulfonyl groups, and preferably from Boc, CBz, 4-nitrobenzyloxycarbamate (4-NO₂-CBz), Fmoc 2-halo-CBz, Alloc and

- 40 -

Me₃SiEtSO₂.

The linker may be cleavable or non cleavable, depending on the requirements of the functional moiety(s) attached. Cleavable linkers may be designed to be enzymatically cleaved, and may for example, be used in macromolecules targeted to tissues expressing
 5 those enzymes. Alternatively, an acid labile linker may be preferred such that the compound attached to it is released under acid conditions, such as in hypoxic tissue.

The linker moiety may include repeating units selected to stiffen the backbone thereof, or may be partially cross-linked to stiffen the backbone.

The linker is made cleavable or non-cleavable by the presence of an appropriate stable or
 10 labile group in the linker. Examples of suitable cleavable and non-cleavable groups in a linker include:

Linker type	Summary
Amide	Generally used as stable linkers.
Hydrazone	Acid labile linkers that are mostly stable at physiological pH have been shown to inhibit the growth of some tumour cells after hydrolysis of the bond to release an anti-tumour drug.
Oxime	Acid labile linkers that are mostly stable at physiological pH have been shown to inhibit the growth of some tumour cells after hydrolysis of the bond to release an anti-tumour drug.
Imine	Acid labile linkers that are mostly stable at physiological pH have been shown to inhibit the growth of some tumour cells after hydrolysis of the bond to release an anti-tumour drug.
Ester	The cleavability of esters are strongly related to their structure and number of cleavable sites, where monoesters are more stable than diesters. In general, esters are less stable than amide bonds and more stable than disulfide bonds. Cleavage of orthoesters is dependent on acidic pH.

Linker type	Summary
Peptide	A large number of peptide bonds have been investigated as generally non specific enzyme cleavable linkers. Their stability depends largely on the molecules they are attached to and the sequence.
disulfide	One of the most unstable linkers available and shows poor stability in circulation. Generally used to facilitate rapid metabolism of toxic species/carriers in target organs.
thymidine	While this has not previously been used as a metabolisable linker, thymidine phosphorylase is over expressed in many solid tumours and catalyses the phosphorolytic cleavage of thymidine to thymine and deoxyribose-1-phosphate.

i) Amide linkers

The nature of an amide bond is important in determining whether the free drug will be released from a conjugate. For instance, conjugation of a drug (e.g. doxorubicin) to a carrier *via* an amide bond produces a conjugate that is hydrolytically stable and which does not exert any anticancer effects *in vitro*. A drug bound directly to a carrier *via* an amide bond will also not be readily cleaved as a free drug, but rather as a drug-amino acid if the carrier is itself degradable. The release of free drug from carriers bound *via* a direct amide linker will only be achievable in rare circumstances where the drug is itself a peptide-like molecule and the bond between drug and carrier is enzymatically cleavable.

ii) Hydrazone, Oxime and Imine linkers

Hydrazone, oxime and imine bonds do not require the presence of enzymes to allow cleavage of the drug from the carrier. They are able to be cleaved hydrolytically at the C=N bond in low pH environments such as in the tumour extravascular space or within lysosomes. Commonly used hydrazone, oxime and imine linkers arise from the reaction of a hydrazine, alkoxyamine or amine moieties, respectively, of a linker with a carbonyl (ketone or aldehyde) of a pharmaceutically active moiety. The link may also be modified

- 42 -

to slow the rate of hydrolysis by modifying the number of alkyl groups surrounding the C=N bond moiety, or by substitution with electron withdrawing (to increase acid lability) or electron donating (to decrease acid lability) moieties.

iii) Ester linkers

- 5 Both acid labile and metabolisable ester linkers can be made. Orthoesters have been used to conjugate PEG to lipids which bind anionic membrane carriers. The stability of the conjugate in acidic conditions (pH 4-6) depends on the structure of the ester or orthoester linker. In general, α -methoxy- ω -{N-(2-octadecyloxy-[1,3]dioxolan-4-yl)methylamido}-polyethyleneglycol₁₁₀ shows good stability at both pH 4 and 5, α -methoxy- ω -{N-(2-cholesteryloxy-[1,3]dioxolan-4-yl)methylamido}-polyethyleneglycol₁₁₀ is very stable at
10 pH 5 but moderately less stable at pH 4, α -methoxy- ω -{N-(2-methyl-s-octadecyloxy-[1,3]dioxan-5-yl)-amido}-polyethyleneglycol₁₁₀ and α -methoxy- ω -{N-2-(3-hydroxypropyl-cholesterylcarbamate)-2-methyl-[1,3]dioxan-5-yl-amido}-polyethyleneglycol₁₁₀ are not stable. In terms of simple ester conjugation to small
15 molecules, diester functionalities provide more sites for metabolic cleavage compared with monoesters which are more stable than disulfides but less stable than amide bonds.

iv) Peptide linkers

- Peptide linkers are by far the most versatile of all cleavable linkers in that many different combinations of amino acids can be used to control the rate of cleavage and the cleavage
20 enzyme. However, these linkers have two problems associated with their use as conjugates for drug and carrier, 1) they are generally cleavable by non specific peptidases throughout the body and may therefore result in non-specific drug toxicity at non-tumour distribution sites and 2) cleavage may occur at a site within the linker that results in an amino acid remaining bound to the drug molecule. This may hinder the chemotherapeutic effect of the
25 drug molecule. Alternatively, the bound amino acid may not alter the pharmacological effects of the drug but may affect its pharmacokinetics. However, these cleavage effects may be controlled by choosing an appropriate amino acid in the peptide linker that is bound directly to the drug molecule, e.g. proline.

- 43 -

Generally, cathepsin B cleavable linkers have been designed to be cleaved following endocytosis of the drug conjugate *via* the lysosome system, as cathepsin is located in lysosomes and not free in the cytosol. Endocytosis is generally initiated following binding of the carrier (which is usually an antibody directed against a cancer specific cell surface
5 receptor or ligand for a cancer specific cell surface receptor) to the cell membrane.

Non-specific proteases (i.e. proteases that are not specific for a particular peptide sequence) may cleave a drug from a PEGylated macromolecule after it has undergone sufficient extravasation and accumulation in tumour tissue.

The following guidelines about the rate of peptide cleavage apply, where $a > b$ indicates
10 that the rate of cleavage of a is greater than the rate of cleavage for b . For peptide sequences used as linkers between an active pharmaceutical and the dendrimer terminal nitrogens: terminal Cys $>$ no terminal Cys Gly $>$ terminal Gly = terminal, Gly Phe Gly $>$ terminal GlyGlyGly and terminal GlyGlyGlyPhe = terminal GlyProGly.

Note: CysGly bonds are reduced by GSH. GlyGlyGly bonds are generally very stable
15 relative to other peptide bonds. The cleavage of dipeptides is generally specific to particular proteases and may be controlled based on the expression of various proteases contained within tumour cells.

v) Disulfide linkers

Disulfide linkers are the most unstable linkers currently used and undergo rapid reductive
20 cleavage *in vitro*. Their *in vivo* stability is generally higher, however, than their *in vitro* stability. They may be formed *via* disulfide linkages between sulphur containing amino acids or at non peptide based disulfide bonds. They also show greater reactivity with other nucleophilic thiols in the body and hence show rapid plasma clearance.

General summary of linker cleavability

In circulation, the order of linker cleavabilities is as follows:

Disulfide > long chained peptides \geq esters > hydrazones \geq tetrapeptides (GlyGlyGlyPhe) = tripeptides (GlyPheGly > GlyGlyGly = GlyProGly) \approx or > dipeptides (AlaVal, AlaPro, GlyPro, PheLeu, Val-Cys) > glutaraldehyde = amide.

The stability of various linkers is based on the groups to which they are conjugated (i.e. accessibility of the enzymes to the linker), the behaviour of the conjugate at the site of required activity (i.e. cellular uptake or extracellular accumulation) and the nature of the conjugate (i.e. ester vs. amide). The *in vivo* behaviour of the disulfide conjugates with the current system is expected to be relatively unpredictable. While long chained peptides are more easily assessed by proteases for rapid cleavage, they may be cleaved too rapidly and at non specific sites, resulting in release of a pharmaceutical active-peptide/amino acid species which may not be biologically active.

Cleavage of a C=N based linker (hydrazone, oxime or imine), ester or peptide conjugates will occur at least over several days which allows the conjugates to accumulate in tumour tissue. Each has its advantages, but ester or hydrazone linkers may be preferred. An ester bond linking a pharmaceutical active to the macromolecule provides a bond that is rapidly cleaved, and though this may not be specific to the target site, cleavage results in the release of free a pharmaceutical active. Hydrazone bonds produce conjugates are more stable in the general circulation than esters and are cleaved with greater specificity at the tumour site *via* hydrolysis at the C=N bond. However, the pharmaceutical active molecule may need to be modified to allow hydrazone formation either by incorporation of a carbonyl or hydrazine moiety.

In some embodiments, the linker moiety may include two reactive groups, F' and Y', which are connected by one or more carbons or heteroatoms, preferably by a hydrocarbon backbone. The reactive group F' may be activated to react with reactive amine moieties like those on the core, or the surface or subsurface layer of the dendritic motif. Typically

- 45 -

the reactive group F' is a carboxylate group or residue thereof. The other functional moiety, Y', is either an amine comprising a protecting group, or it is selected such that it has a specific reactivity that is complementary to a reactive group of a desired functional moiety that is to be attached to the core, or the surface layer or subsurface layer of a dendritic motif. Typical examples of Y' include amine, hydroxyl, thiol, alkenyl or alkynyl, nitrile, halide, carboxylate or azido groups.

In addition to the linkers described above, photocleavable linkers may be used with the present invention. For example, heterobifunctional, photocleavable linkers may be used. Heterobifunctional, photocleavable linkers may be either water or organic soluble. They contain an activated ester that may react with amines or alcohols and an epoxide that may react with a thiol group. Between the ester and epoxide groups is a 3,4-dimethoxy-6-nitrophenyl photoisomerisation group, which, when exposed to near-ultraviolet light (365 nm), releases the amine or alcohol in intact form. Thus, the pharmaceutically active component, when linked to the macromolecule using such linkers, may be released in biologically active or activatable form through exposure of the target area to near-ultraviolet light.

In further embodiments, preparation of the macromolecule may further include the step of modifying the amine group and/or linker and/or functional moiety to facilitate ligation of the functional moiety to the amine, either directly or *via* the cleavable or non-cleavable linker.

Thus, the amine group at the surface or core of the macromolecule can be modified by a modifier group to facilitate attachment to the linker or functional moiety. Alternatively, or in addition, the linker may be modified to facilitate attachment to the surface or core amine group.

The terminus of the linker for attachment to the functional moiety may be modified by a modifier group to facilitate attachment to the functional moiety. Alternatively, or in addition, the functional group may be modified by a modifier group to facilitate attachment to the linker or directly to the surface or core amine group.

- 46 -

In a particular embodiment, the first amino nitrogen atom of the core and/or a linker used to attach the first functional moiety and/or the first functional moiety is further modified to facilitate attachment of the first functional moiety to the core.

5 The amino (surface or core) moiety and/or linker and/or functional moiety may be modified to allow for the ligation either of the functional moiety, to the amino atom, *via* the linker by derivatisation with a group that includes a chemical moiety selected from: a haloacetamide, a maleimide or other thiol reactive moiety, a reactable thiol or exchangeable disulfide moiety, an aliphatic or aromatic aldehyde, a ketone, an alkoxyamine, a hydrazine, an azide, an alkyne, an oligohistidine array and any peptide
10 array, a nitrilotriacetic acid group, any carboxylate or reactive residue thereof (such as activated esters); any chemical moiety capable of reacting with an organic halide such as an organostannyl group, an acrylate, a boronic acid (or ester) and organic alkynes *via* metal catalysed coupling reactions, namely Stille, Heck, Suzuki and Sonogashira respectively, any moiety capable of enzymatic ligation (e.g. through the use of a transglutaminase), any
15 moiety capable of native chemical ligation. Methods for derivatisation to incorporate the modifier are known in the art.

More preferably, the chemical modifier may be selected from the following

(i) Maleimide

20 (ii) Haloacetamide (X = Cl, Br, I)

- 47 -

(iii) Hydrazide

(iv) Alkoxyamine

5 (v) 3-(2-Pyridyldithiothio)propionate

In certain embodiments, the surface or core amine may be modified to allow for the ligation of the functional moiety by derivatisation with a group that includes a chemical moiety selected from: haloacetamide, maleimide or other thiol reactive moiety, a reactable
 10 thiol or exchangeable disulfide moiety, aldehyde, ketone, an alkoxyamine moiety, hydrazine, azide, alkyne, oligohistidine array, nitrilotriacetic acid motif.

In a preferred method, the protecting group of the selected amine, such as the core amine, is removed, and the amine is reacted with a haloacetic acid derivative, or a maleimide derivative such as 3-maleimidopropionic acid or 4-maleimidobutyric acid under conditions
 15 where the amide bond is formed. General methods for the coupling of thiol containing peptides and proteins to such thiol active groups are described in Hermanson, G.T. *Bioconjugate Techniques* (Academic Press 1996) and the references cited therein.

General methods for the covalent coupling of macromolecules to molecules such as peptides and antibodies are within the level of skill in the art. Such methods are described
 20 in Hermanson, G.T. *Bioconjugate Techniques* (Academic Press 1996) and the references cited therein, Blatter et al, *Biochem.*, 24: 1517 (1985) and Jue et al, *Biochem.*, 17:5399

- 48 -

(1978). Methods for the ligation of peptides or proteins containing adjacent histidine residues with macromolecules or solid supports containing the nitrilotriacetic acid motif through complexation with nickel are described in Hochuli et al *J. Chromatogr.* 1987 411 177, Sigal et al *Anal. Chem.* 1996 68 490 and Gershon et al *J. Immunol. Meth.* 1995 183
5 65. The references cited above are incorporated herein by reference in their entirety.

The macromolecules of the invention may be prepared by a divergent or convergent dendrimer synthesis. Methods for divergent and convergent syntheses are known in the art. In one embodiment, the macromolecule is constructed *via* a divergent synthesis, wherein the last (surface) layer of building units added may have optionally protected
10 amino groups and/or bear amino groups which have the functional moieties already attached or are modified with a modifier and/or bear a linker moiety for subsequent attachment of a functional moiety.

Alternatively, in a convergent synthesis, dendritic motifs, or wedge, comprising more than a single building unit, can be attached to the core or surface amino groups of a dendrimer.
15 Again, the surface amino groups of a dendritic motif may be optionally protected and/or may already have one or more functional groups attached, and/or are modified with a modifier and/or bear a linker moiety for the functional moiety.

In another aspect the invention also contemplates compositions comprising a macromolecule as described herein together with a pharmaceutically acceptable excipient,
20 carrier or adjuvant thereof.

The invention further provides for the use of macromolecules as described herein in therapy.

Subjects to be treated include mammalian subjects: humans, primates, livestock animals (including cows, horses, sheep, pigs and goats), companion animals (including dogs, cats,
25 rabbits, guinea pigs), and captive wild animals. Laboratory animals such as rabbits, mice, rats, guinea pigs and hamsters are also contemplated as they may provide a convenient test system. Non-mammalian species such as birds, amphibians and fish may also be

- 49 -

contemplated in certain embodiments of the invention.

In certain embodiments, the macromolecules according to the invention, when administered according to the desired dosing regimen, at least partially attain a desired therapeutic or prophylactic effect, including one or more of: alleviating the symptoms of, preventing or delaying the onset of, inhibiting the progression of, or halting or reversing altogether the onset or progression of the particular disorder or condition being treated.

The active ingredient may be administered in a single dose or a series of doses. While it is possible for the active ingredient to be administered alone, it is preferable to present it as a composition, preferably as a pharmaceutical composition, with one or more pharmaceutically acceptable adjuvants.

The formulation of such compositions is well known to those skilled in the art, see for example, *Remington's Pharmaceutical Sciences*, 18th Edition, Mack Publishing, 1990. The composition may contain any suitable carriers, diluents or excipients. These include all conventional solvents, dispersion media, fillers, solid carriers, coatings, antifungal and antibacterial agents, dermal penetration agents, surfactants, isotonic and absorption agents and the like. It will be understood that the compositions of the invention may also include other supplementary physiologically active agents.

The carrier must be pharmaceutically acceptable in the sense of being compatible with the other ingredients of the composition and not injurious to the subject. Compositions include those suitable for oral, rectal, nasal, topical (including dermal, buccal and sublingual), vaginal or parental (including subcutaneous, intramuscular, intravenous and intradermal) administration. The compositions may conveniently be presented in unit dosage form and may be prepared by any methods well known in the art of pharmacy. Such methods include the step of bringing into association the active ingredient with the carrier which constitutes one or more accessory ingredients. In general, the compositions are prepared by uniformly and intimately bringing into association the active ingredient with liquid carriers or finely divided solid carriers or both, and then if necessary shaping the product.

- 50 -

Compositions of the present invention suitable for oral administration may be presented as discrete units such as capsules, sachets or tablets each containing a predetermined amount of the active ingredient; as a powder or granules; as a solution or a suspension in an aqueous or non-aqueous liquid; or as an oil-in-water liquid emulsion or a water-in-oil liquid emulsion.

A tablet may be made by compression or moulding, optionally with one or more accessory ingredients. Compressed tablets may be prepared by compressing in a suitable machine the active ingredient in a free-flowing form such as a powder or granules, optionally mixed with a binder (e.g. inert diluent), preservative disintegrant (e.g. sodium starch glycolate, cross-linked polyvinyl pyrrolidone, cross-linked sodium carboxymethyl cellulose) surface-active or dispersing agent. Moulded tablets may be made by moulding in a suitable machine a mixture of the powdered compound moistened with an inert liquid diluent. The tablets may optionally be coated or scored and may be formulated so as to provide slow or controlled release of the active ingredient therein using, for example, hydroxypropylmethyl cellulose in varying proportions to provide the desired release profile. Tablets may optionally be provided with an enteric coating, to provide release in parts of the gut other than the stomach.

Compositions suitable for topical administration in the mouth include lozenges comprising the active ingredient in a flavoured base, usually sucrose and acacia or tragacanth gum; pastilles comprising the active ingredient in an inert basis such as gelatin and glycerin, or sucrose and acacia gum; and mouthwashes comprising the active ingredient in a suitable liquid carrier.

Compositions suitable for topical administration to the skin may comprise the compounds dissolved or suspended in any suitable carrier or base and may be in the form of lotions, gel, creams, pastes, ointments and the like. Suitable carriers include mineral oil, propylene glycol, polyoxyethylene, polyoxypropylene, emulsifying wax, sorbitan monostearate, polysorbate 60, cetyl esters wax, cetearyl alcohol, 2-octyldodecanol, benzyl alcohol and water. Devices for transdermal delivery, such as patches, may also be used to administer the compounds of the invention.

- 51 -

Compositions for rectal administration may be presented as a suppository with a suitable base comprising, for example, cocoa butter, glycerin, gelatin or polyethylene glycol.

Compositions suitable for vaginal administration may be presented as pessaries, tampons, creams, gels, pastes, foams or spray formulations containing in addition to the active
5 ingredient such carriers as are known in the art to be appropriate.

Compositions suitable for parenteral administration include aqueous and non-aqueous isotonic sterile injection solutions which may contain anti-oxidants, buffers, bactericides and solutes which render the composition isotonic with the blood of the intended recipient; and aqueous and non-aqueous sterile suspensions which may include suspending agents
10 and thickening agents. The compositions may be presented in unit-dose or multi-dose sealed containers, for example, ampoules and vials, and may be stored in a freeze-dried (lyophilised) condition requiring only the addition of the sterile liquid carrier, for example water for injections, immediately prior to use. Extemporaneous injection solutions and suspensions may be prepared from sterile powders, granules and tablets of the kind
15 previously described.

Preferred unit dosage compositions are those containing a daily dose or unit, daily sub-dose, as herein above described, or an appropriate fraction thereof, of the active ingredient.

It should be understood that in addition to the active ingredients particularly mentioned above, the compositions of this invention may include other agents conventional in the art
20 having regard to the type of composition in question, for example, those suitable for oral administration may include such further agents as binders, sweeteners, thickeners, flavouring agents disintegrating agents, coating agents, preservatives, lubricants and/or time delay agents. Suitable sweeteners include sucrose, lactose, glucose, aspartame or saccharine. Suitable disintegrating agents include corn starch, methylcellulose,
25 polyvinylpyrrolidone, xanthan gum, bentonite, alginic acid or agar. Suitable flavouring agents include peppermint oil, oil of wintergreen, cherry, orange or raspberry flavouring. Suitable coating agents include polymers or copolymers of acrylic acid and/or methacrylic acid and/or their esters, waxes, fatty alcohols, zein, shellac or gluten. Suitable

- 52 -

preservatives include sodium benzoate, vitamin E, alpha-tocopherol, ascorbic acid, methyl paraben, propyl paraben or sodium bisulphite. Suitable lubricants include magnesium stearate, stearic acid, sodium oleate, sodium chloride or talc. Suitable time delay agents include glyceryl monostearate or glyceryl distearate.

- 5 Pharmaceutical compositions of this invention can be administered to mammals including humans in a manner similar to other therapeutic agents in treatment-effective amounts. A treatment effective amount is intended to include an amount which, when administered according to the desired dosing regimen, at least partially attains the desired therapeutic or prophylactic effect, as above. The dosage to be administered, and the mode of
- 10 administration, will depend on a variety of factors including age, weight, sex, condition of the patient and genetic factors, and will ultimately be decided by medical personnel subsequent to experimental determinations of varying dosage followed by imaging as described herein. In general, dosage required for diagnostic sensitivity or therapeutic efficacy will range from about 0.001 to 50,000 µg/kg, preferably between 0.01 to 25.0
- 15 µg/kg of host body mass. The optimal dose will be determined empirically following the disclosure herein.

It will be understood that the functional moieties, particularly pharmaceutically active agents, may be present as pharmaceutically acceptable salts or prodrugs. The term "prodrug" is used in its broadest sense and encompasses those derivatives that are

20 converted *in vivo*, either enzymatically or hydrolytically, to the compounds of the invention. Such derivatives would readily occur to those skilled in the art, and include, for example, compounds where a free thiol or hydroxy group is converted into an ester, such as an acetate, or thioester or where a free amino group is converted into an amide. Procedures for acylating the compounds of the invention, for example to prepare ester and

25 amide prodrugs, are well known in the art and may include treatment of the compound with an appropriate carboxylic acid, anhydride or chloride in the presence of a suitable catalyst or base. Esters of carboxylic acid (carboxy) groups are also contemplated. Suitable esters C₁₋₆alkyl esters; C₁₋₆alkoxymethyl esters, for example methoxymethyl or ethoxymethyl; C₁₋₆alkanoyloxymethyl esters, for example, pivaloyloxymethyl; phthalidyl

- 53 -

esters; C₃₋₈cycloalkoxycarbonylC₁₋₆alkyl esters, for example, 1-cyclohexylcarbonyloxyethyl; 1,3-dioxolen-2-onylmethyl esters, for example, 5-methyl-1,3-dioxolen-2-onylmethyl; and C₁₋₆alkoxycarbonyloxyethyl esters, for example, 1-methoxycarbonyloxyethyl. Prodrugs of amino functional groups include amides (see, for example, *Adv. BioSci.*, 1979, 20, 369, Kyncl, J. *et al*), enamines (see, for example, *J. Pharm. Sci.*, 1971, 60, 1810, Caldwell, H. *et al*), Schiff bases (see, for example, US Patent No 2,923,661 and *Antimicrob. Agents Chemother.*, 1981, 19, 1004, Smyth, R. *et al*), oxazolidines (see, for example, *J. Pharm. Sci.*, 1983, 72, 1294, Johansen, M. *et al*), Mannich bases (see, for example, *J. Pharm. Sci.* 1980, 69, 44, Bundgaard, H. *et al* and *J. Am. Chem. Soc.*, 1959, 81, 1198, Gottstein, W. *et al*), hydroxymethyl derivatives (see, for example, *J. Pharm. Sci.*, 1981, 70, 855, Bansal, P. *et al*) and N-(acyloxy)alkyl derivatives and carbamates (see, for example, *J. Med. Chem.*, 1980, 23, 469, Bodor, N. *et al*, *J. Med. Chem.*, 1984, 27, 1037, Firestone, R. *et al*, *J. Med. Chem.*, 1967, 10, 960, Kreiger, M. *et al*, US Patent No 5,684,018 and *J. Med. Chem.*, 1988, 31, 318-322, Alexander, J. *et al*). Other conventional procedures for the selection and preparation of suitable prodrugs are known in the art and are described, for example, in WO 00/23419; *Design of Prodrugs*, H. Bundgaard, Ed., Elsevier Science Publishers, 1985; *Methods in Enzymology*, 42: 309-396, K. Widder, Ed, Academic Press, 1985; *A Textbook of Drug Design and Development*, Krogsgaard-Larsen and H. Bundgaard, Eds, Chapter 5, p113-191 (1991); *Advanced Drug Delivery Reviews*, 8; 1-38 (1992); *Journal of Pharmaceutical Sciences*, 77;285 (1988), H. Bundgaard, *et al*; *Chem Pharm Bull*, 32692 (1984), N. Kakeya *et al* and *The Organic Chemistry of Drug Desig and Drug Action*, Chapter 8, pp352-401, Academic press, Inc., 1992.

Suitable pharmaceutically acceptable salts include, but are not limited to salts of pharmaceutically acceptable inorganic acids such as hydrochloric, sulphuric, phosphoric nitric, carbonic, boric, sulfamic, and hydrobromic acids, or salts of pharmaceutically acceptable organic acids such as acetic, propionic, butyric, tartaric, maleic, hydroxymaleic, fumaric, maleic, citric, lactic, mucic, gluconic, benzoic, succinic, oxalic, phenylacetic, methanesulphonic, toluenesulphonic, benzenesulphonic, salicyclic sulphanilic, aspartic, glutamic, edetic, stearic, palmitic, oleic, lauric, pantothenic, tannic, ascorbic, fendizoic, 4-

- 54 -

4'-methylenebis-3-hydroxy-2-naphthoic acid, *o*-(*p*-hydroxybenzoyl)benzoic, 4'-4''-
dihydroxytriphenylmethane-2-carboxylic acid and valeric acids. Base salts include, but are
not limited to, those formed with pharmaceutically acceptable cations, such as sodium,
potassium, lithium, calcium, magnesium, ammonium and alkylammonium. Basic
5 nitrogen-containing groups may be quaternised with such agents as lower alkyl halide,
such as methyl, ethyl, propyl, and butyl chlorides, bromides and iodides or dialkyl sulfates
such as dimethyl and diethyl sulfate.

It will be understood that the invention disclosed and defined in this specification extends
to all alternative combinations of two or more of the individual features mentioned or
10 evident from the text or drawings. All of these different combinations constitute various
alternative aspects of the invention.

The present invention will now be more fully described with reference to the
accompanying examples. It should be understood, however, that the description following
is illustrative only and should not be taken in any way as a restriction on the generality of
15 the invention described above.

EXAMPLES

The invention will now be described with reference to the following non-limiting illustrative examples and figures.

A system of nomenclature has been developed for the purposes of identifying the individual compounds described in this patent. This nomenclature is used to simplify the description of the compounds and is used in place of what would be a complex IUPAC name, the use of which may be prone to error and difficult to interpret.

The macromolecule nomenclature makes use of the following abbreviations:

Abbreviation	Name	Structure ¹
NEOEOEN	2-[2-(2-aminoethoxy)ethoxy]-ethylamine	
[CBz] NEOEOEN	Benzyloxycarbonylamino-3,6-oxa-8-aminoctane	
[Boc] NEOEOEN	t-butoxycarbonylamino-3,6-oxa-8-aminoctane	
Su(NPN) ₂		
Lys	Lysine	
DBL-OPNP	<i>p</i> -nitrophenyl active ester of di-Boc Lysine	

- 56 -

Abbreviation	Name	Structure ¹
NH ₂ .TFA	Represents the surface amine groups of the deprotected molecule as the TFA salt	
Boc	t-butyloxycarbonyl	
CBz	Benzyloxycarbonyl	
<i>p</i> -NO ₂ -CBz	<i>p</i> -nitro-benzyloxycarbonyl	
COCH ₂ O-3,6-Naph(SO ₃ Na) ₂	1-carboxy-3,6-naphthyldisulfonic acid di-sodium salt	
CO-4-Ph(SO ₃ Na)	1-carboxy-4-phenylsulfonic acid di-sodium salt	
(NPN) ₂ [CBz] ₂		
(NPN) ₂ [Boc] ₂		
HO-Su(NPN) ₂ [CBz] ₂		

- 57 -

Abbreviation	Name	Structure ¹
HO-Su(NPN) ₂ [Boc] ₂		
PNPO-Su(NPN) ₂ [CBz] ₂		
PNPO-Su(NPN) ₂ [Boc] ₂		
MeOGly.HCl		
PNPO-α-Boc-ε-CBz-Lys		
biotin-NHS ester		

Further abbreviations are as follows:

Abbreviation	Full Name
PyBop	Benzotriazole-1-yl-oxy-tris-pyrrolidino-phosphonium hexafluorophosphate
DIPEA	N,N-Diisopropylethylamine
TEA	Triethylamine
DCC	1,3-Dicyclohexylcarbodiimide
HOBt	1-Hydroxybenzotriazole hydrate
DMAP	4-(Dimethylamino)pyridine
NHS	N-hydroxysuccinimide
TFA	Trifluoroacetic acid
DCM	Dichloromethane
EtOAc	Ethyl acetate
MeOH	Methanol
MeCN	Acetonitrile
DMF	Dimethylformamide
DMSO	Dimethylsulfoxide
PBS	Phosphate buffered saline
TLC	Thin Layer Chromatography
HPLC	High Performance Liquid Chromatography
MS	Mass Spectrometry
MTX	Methotrexate
THF	tetrahydrofuran

- 59 -

HPLC and MS equipment details:

HPLC – Waters 2795 with 2996 Diode Array Detector (DAD)

MS – Waters ZQ4000 with ESI probe, inlet flow split to give around 50 μ L/min to the MS.

Mass Spectra data was acquired in positive or negative electrospray ionisation mode as indicated. The raw data was deconvoluted using a Maximum Entropy algorithm (MaxEnt) as implemented in MassLynx software v4.0, supplied by Waters Corporation. The data reported in the experimental details corresponds to the observed value after deconvolution to a theoretical zero charge state. All PEG reagents were obtained from commercial sources and used as received.

10

Example 1

β -Lactoglobulin-MAL- $(\text{CH}_2)_2\text{CONH-PEG}_{1100}\text{-CO-NEOEOEN}$ [Su(NPN)₂] [Lys]₁₆
[PEG₅₇₀]₃₂

i. Benzyloxycarbonylamino-3,6-oxa-8-aminooctane: [CBz] NEOEOEN

15 To a solution of 2,2'-(ethylenedioxy)diethylamine (4.45 g, 30 mmol) and TEA (0.7 mL, 50 mmol) in MeCN (50 mL), was added dropwise over 20 min a solution of N-(benzyloxycarbonyloxy)succinimide (1.2 g, 5.0 mmol) in MeCN (10 mL). Once the addition was complete the solution was stirred at room temperature overnight. MeCN was removed *in vacuo* and the resulting colourless residue redissolved in water (50 mL). The
20 aqueous solution was washed with DCM (3 \times 25 mL) and the combined organic extracts reduced *in vacuo*. The residue was dissolved in 2M HCl (25 mL) and washed with diethyl ether (3 \times 25 mL). The aqueous layer was then neutralized to pH 7 with NaOH and evaporated to dryness *in vacuo*. The resulting residue was added to EtOAc (25 mL), filtered and dried over Na₂SO₄. Removal of solvent *in vacuo* provided a colourless oil (840
25 mg, 2.9 mmol, 60%). ESI MS (+ve) 283 [M+H]⁺; calc. m/z for C₁₄H₂₂N₂O₄ [M+H]⁺: 283.34.

- 60 -

ii. *tert*-Butyl 2-({2-[(*tert*-butoxycarbonyl)amino]propyl}amino)propylcarbamate

A solution of dipropylenetriamine (171 g, 1.32 mol) in THF (200 mL) was added dropwise over 1h to a solution of *tert*-butyl-1H-imidazole-1-carboxylate (444 g, 2.64 mol) in THF (1.2 L) at room temperature. The resulting solution was refluxed for 4h and then stirred at
5 room temperature overnight. The THF was removed *in vacuo* and the residue dissolved in DCM (2 L). The DCM solution was first washed with NaOH (2M, 2 × 1 L) and then citric acid 10 % w/v (2 × 1 L). The aqueous citric acid solution was basified with NaOH (4 M, until pH 14), extracted with DCM (3 × 600 mL) and the combined DCM extracts concentrated *in vacuo* to afford a clear oil, which solidified on cooling to yield a white
10 solid (346 g, 80 %).

iii. HO-Su(NPN)₂ [Boc]₂

A 3 L vessel fitted with an overhead stirrer was charged with *tert*-Butyl 2-({2-[(*tert*-butoxycarbonyl)amino]propyl}amino)propylcarbamate (208.5 g, 0.63 mol) and toluene (900 mL). Succinic anhydride (63 g, 0.63 mol) was added in one portion and the resulting
15 solution heated at 60 °C overnight. The mixture was cooled to room temperature, diethyl ether was added (1 × 200 mL) and the solid filtered. The solid was washed with diethyl ether (2 × 200 mL) and dried to yield a white solid (230 g, 91%).

iv. [CBz] NEOEOEN [Su(NPN)₂] [Boc]₂

To a solution of [CBz] NEOEOEN (Example 1i) (440 mg, 1.6 mmol) in DMF (4 mL), was
20 added TEA (0.22 mL, 1.6 mmol) and PNPO-Su(NPN)₂-Boc₂ (950 mg, 1.8 mmol). The solution was stirred at room temperature overnight. Solvent was removed *in vacuo* and the residue dissolved in EtOAc (250 mL). This solution was washed with brine (125 mL), 1M Na₂CO₃ (3 × 50 mL), water (125 mL), 1M KHSO₄ and a second wash of brine (125 mL) before drying over Na₂SO₄. The solution was concentrated *in vacuo* and purified by silica
25 gel chromatography (MeOH / DCM gradient) to provide a clear viscous oil (165 mg, 0.23 mmol, 15%). ESI MS (+ve) 496 [M+H]⁺; calc. m/z for C₂₄H₄₁N₅O₆ [M+H]⁺: 496.61.

- 61 -

v. [CBz] NEOEOEN [Su(NPN)₂] [NH₂.TFA]₂

[CBz] NEOEOEN [Su(NPN)₂] [Boc]₂ (13.89 g, 20.0 mmol) was dissolved in acetic acid (50 mL) and the stirred solution cooled in an ice bath. Ice cooled TFA (50 mL, 0.73 mol) was added at a rate that maintained the temperature of the solution at or below 5° C. The ice bath was removed and the solution stirred at room temperature for 5h. It was then cooled and ice-cooled water (100 mL) was added at a rate that kept the mixture below 5° C. The volatiles were evaporated *in vacuo* and water (100 mL) was added to the oily residue. The solution was then concentrated *in vacuo* and the process was repeated with more water (2 x 100mL). The oil was dissolved in water (50 mL), the solution filtered and freeze dried to give [CBz] NEOEOEN [Su(NPN)₂] [NH₂.TFA]₂ (17.1 g) as a colourless glassy solid. ¹H-NMR (300 MHz, CD₃OD) δ (ppm) 1.90 (apparent quintet, *J* = 6.6 Hz, 2H); 1.99 (m, 2H); 2.57 (m, 2H); 2.65 (m, 2H); 2.89 (t, *J* = 6.6 Hz, 2H); 3.00 (t, *J* = 7.5 Hz, 2H); 3.30-3.38 (complex, 6H); 3.42-3.58 (complex, 6H); 3.61 (s, 4H); 5.08 (s, 2H); 7.25-7.40 (complex, 5H); HPLC (Hydrophilic/TFA) Rt = 8.0 min; ESI MS (+ve) 496.2 [M+H]⁺; calc. m/z for C₂₄H₄₂N₅O₆⁺ [M+H]⁺: 496.3.

vi. [CBz] NEOEOEN [Su(NPN)₂] [Lys]₂ [Boc]₄

A solution of DBL-OPNP (12.8 g, 17.7 mmol) in DMF (80 mL) was added to a solution of [CBz] NEOEOEN [Su(NPN)₂] [NH₂.TFA]₂ (19.5 g, 35.4 mmol) and TEA (17.9 g, 0.177 mol) in DMF (80 mL) at room temperature. After stirring for 16 h, a solution of glycine (1.50 g, 29.0 mmol) in water (50 mL) was added and stirring continued for 16h. Volatiles were removed *in vacuo*, the residue dissolved in EtOAc (200 mL) and the solution washed sequentially with 5% w/v Na₂CO₃ (10 x 50 mL), brine (50 mL), 1M HCl (2 x 50 mL) and again with brine (50 mL). The EtOAc solution was dried (Na₂SO₄), filtered and the solvent removed *in vacuo* to give the product as a colourless oil (20.74 g). ¹H-NMR (300 MHz, CD₃OD) δ (ppm) 1.15-1.95 (complex, 16H); 1.43 (s, 18H); 1.44 (s, 18H); 2.51 (m, 2H); 2.64 (m, 2H); 3.02 (t, *J* 6.6 Hz, 4H); 3.17 (m, 2H); 3.25-3.45 (complex, 8H); 3.48-3.58 (complex, 4H); 3.61 (s, 4H); 5.08 (s, 2H); 7.25-7.40 (complex, 5H). HPLC (Hydrophobic/TFA) Rt = 8.6 min; ESI MS (+ve) 1153.0 [M+H]⁺; calc. m/z for C₅₆H₉₈N₉O₁₆⁺ [M+H]⁺: 1152.7.

- 62 -

vii. [CBz] NEOEOEN [Su(NPN)₂] [Lys]₂ [NH₂.TFA]₄

[CBz] NEOEOEN [Su(NPN)₂] [Lys]₂ [Boc]₄ (20.74 g, 18.0 mmol) was dissolved in acetic acid (50 mL) and the stirred solution cooled in an ice bath. Ice cooled TFA (50 mL, 0.73 mol) was added at a rate that maintained the temperature of the solution at or below 5° C. The ice bath was removed and the solution stirred at room temperature for 5h. The solution was then cooled to 5° C and added to ice-cold water (100 mL) at a rate that kept the mixture below 5° C. Volatiles were evaporated *in vacuo* and water (100 mL) was added to the residual oil. The resultant solution was then concentrated *in vacuo* and the process was repeated with more water (2 x 100 mL). The oil was dissolved in water (50 mL), the solution filtered and freeze dried to give [CBz] NEOEOEN [Su(NPN)₂] [Lys]₂ [NH₂.TFA]₄ (25.1 g) as a pale yellow glassy solid. ¹H-NMR (300 MHz, D₂O) δ (ppm) 1.44 (m, 4H); 1.70 (m, 6H); 1.86 (m, 6H); 2.50 (m, 2H); 2.64 (m, 2H); 2.99 (t, *J* 7.2 Hz, 2H); 3.12-3.47 (complex, 12H); 3.52-3.63 (complex, 12H); 3.95 (m, 2H); 5.12 (s, 2H); 7.32-7.50 (complex, 5H); HPLC (Hydrophilic/TFA) Rt = 10.4 min; ESI MS (+ve) 752.4 [M+H]⁺; calc. m/z for C₃₆H₆₆N₉O₈⁺ [M+H]⁺: 752.5.

viii. [CBz] NEOEOEN [Su(NPN)₂] [Lys]₄ [Boc]₈

A solution of DBL-OPNP (16.8 g, 13.9 mmol) in DMF (100 mL) was added to a solution of [CBz] NEOEOEN [Su(NPN)₂] [Lys]₂ [NH₂.TFA]₄ (33.98 g, 61.3 mmol) and TEA (13.5 g, 0.134 mol) in DMF (100 mL) at room temperature. After stirring for 11h, a 1M aqueous solution of glycine (10 mL) was added; the same quantity of glycine solution was added again after 1h and again 1.5h later. Stirring was continued for a further 2h and the volatiles were then evaporated *in vacuo*. The residue was dissolved in EtOAc (200 mL) and the solution washed sequentially with 0.5 M HCl (2 x 50 mL), 10% w/v Na₂CO₃ (6 x 50 mL) and brine (50 mL). The EtOAc solution was dried (Na₂SO₄), filtered and the solvent removed *in vacuo* to give the desired product as a colourless oil (26.26 g, 91%). ¹H-NMR (300 MHz, *d*₆-DMSO) δ (ppm) 1.00-1.75 (complex, 112H); 2.32 (m, 2H); 2.47 (m, 2H); 2.75-3.50 (complex, 32H); 3.75-3.90 (complex, 4H); 4.10-4.25 (complex, 2H); 5.01 (s, 2H); 6.38 (br. m, 1H); 6.60-6.95 (complex, 8H); 7.25 (m, 1H); 7.28-7.39 (complex, 5H);

- 63 -

7.60-8.05 (complex, 7H). HPLC (Hydrophobic/TFA) $R_t = 15.2$ min; ESI MS (+ve) 1033.8 $[M+2H]^{2+}/2$; calc. m/z for $C_{100}H_{179}N_{17}O_{28}^{2+}$ $[M+2H]^{2+}/2$: 1033.7.

ix. [CBz] NEOEOEN [Su(NPN)₂] [Lys]₄ [NH₂.TFA]₈

[CBz] NEOEOEN [Su(NPN)₂] [Lys]₄ [Boc]₈ (24.52 g, 11.9 mmol) was dissolved in acetic acid (108 mL) and the stirred solution cooled in an ice bath until the acetic acid began to freeze. TFA (108 mL, 1.40 mol) was then added at a rate that maintained the temperature of the solution at or below 10° C. The ice bath was then removed and the solution stirred at room temperature for 15h. The acetic acid and TFA were evaporated *in vacuo* and water (100 mL) was added to the residual oil. The solution was then concentrated *in vacuo* and the process was repeated with more water (3 x 100 mL). The resultant oil was dissolved in water (100 mL), the solution filtered and then freeze dried to give [CBz] NEOEOEN [Su(NPN)₂] [Lys]₄ [NH₂.TFA]₈ (29.2 g) as a colourless glassy solid. ¹H-NMR (300 MHz, D₂O) δ (ppm) 1.25-2.05 (complex, 40H); 2.53' (m, 2H); 2.65 (m, 2H); 2.95-3.10 (complex, 8H); 3.10-3.45 (complex, 16H); 3.55-3.75 (complex, 8H); 3.95 (t, J 6.6 Hz, 2H); 4.06 (t, J 6.6 Hz, 2H); 4.20-4.30 (complex, 2H); 5.15 (s, 2H); 7.35-7.55 (complex, 5H); HPLC (Hydrophilic/Formate) $R_t = 8.4$ min; ESI MS (+ve) 1265.1 $[M+H]^+$, 633.0 $[M+2H]^{2+}/2$; calc. m/z for $C_{60}H_{114}N_{17}O_{12}^+$ $[M+H]^+$: 1264.9, calc. m/z for $C_{60}H_{115}N_{17}O_{12}^{2+}$ $[M+2H]^{2+}$: 633.0.

x. [CBz] NEOEOEN [Su(NPN)₂] [Lys]₈ [Boc]₁₆

A solution of DBL-OPNP (48.2 g, 87.2 mmol) in DMF (120 mL) was added to a solution of [CBz] NEOEOEN [Su(NPN)₂] [Lys]₄ [NH₂.TFA]₈ (25.83 g, 11.87 mmol) and TEA (23.1 g, 0.228 mol) in DMF (150 mL) at room temperature. After stirring for 19h, a solution of glycine (3.27 g, 43.6 mmol) in water (80 mL) was added. Stirring continued for 2h and then the volatiles were evaporated *in vacuo*. The residue was dissolved in EtOAc (200 mL) and the solution washed sequentially with 5% w/v Na₂CO₃ (1 x 100 mL; 4 x 50 mL), 1M HCl (2 x 50 mL) and again with brine (50 mL). The EtOAc solution was dried (Na₂SO₄), hot filtered and the solvent removed *in vacuo* to give the desired product as a yellow glassy solid (27.12 g, 59%). Some of the product precipitated in the fluted filter

- 64 -

paper; dissolution of this material in methanol, filtration and removal of methanol *in vacuo* gave additional product (9.02 g, 20%) as a yellow foam. Analysis of both portions of the product gave identical sets of ¹H-NMR and ESI MS data. ¹H-NMR (300 MHz, CD₃OD) δ (ppm) 1.00-1.75 (complex, 232H); 2.51 (m, 2H); 2.65 (m, 2H); 2.75-3.50 (complex, 40H); 3.50-3.65 (complex, 8H); 3.90-4.50 (complex, 14H); 5.08 (s, 2H); 7.25-7.40 (complex, 5H). HPLC (Hydrophobic/TFA) Rt = 19.7 min; ESI MS (+ve) 1947.3 [M+2H]²⁺/2, 1298.3 [M+3H]³⁺/3; calc. m/z for C₁₈₈H₃₃₉N₃₃O₅₂²⁺ [M+2H]²⁺/2: 1946.8, calc. m/z for C₁₈₈H₃₄₀N₃₃O₅₂³⁺ [M+3H]³⁺/3: 1298.2.

xi. [CBz] NEOEOEN [Su(NPN)₂] [Lys]₈ [NH₂.TFA]₁₆

10 [CBz] NEOEOEN [Su(NPN)₂] [Lys]₈ [Boc]₁₆ (25.75 g, 6.62 mmol) was dissolved in acetic acid (122 mL) and the stirred solution cooled in an ice bath until the acetic acid began to freeze. The ice bath was removed and TFA was carefully added until the acetic acid just melted. The stirred solution was once again placed in the ice bath and the remainder of the TFA (total amount of TFA used was 108 mL, 1.40 mol) was then added at a rate that
15 maintained the temperature of the solution at or below 10° C. The ice bath was removed and the solution stirred at room temperature for 17h. The solution was cooled on ice and then added to ice cold water (400 mL) while making sure that the temperature of the resultant solution remained below 10° C. The volatile components were evaporated *in vacuo* and water (250 mL) was added to the oily residue. The solution was then
20 concentrated *in vacuo* and the process was repeated with more water (2 x 250 mL). The final oil was dissolved in water (200 mL), the solution filtered and freeze dried to give [CBz] NEOEOEN [Su(NPN)₂] [Lys]₈ [NH₂.TFA]₁₆ (27.6 g) as a colourless glassy solid. ¹H-NMR (300 MHz, D₂O) δ (ppm) 1.25-1.65 (complex, 40H); 1.65-2.05 (complex, 48H); 2.50 (m, 2H); 2.62 (m, 2H); 2.95-3.05 (complex, 16H); 3.05-3.45 (complex, 24H); 3.55-
25 3.70 (complex, 8H); 3.94 (t, *J* 6.6 Hz, 4H); 4.05 (t, *J* 6.6 Hz, 4H); 4.15-4.30 (complex, 4H); 4.30-4.40 (complex, 2H); 5.13 (s, 2H); 7.35-7.50 (complex, 5H); HPLC (Hydrophilic/TFA) Rt = 8.9 min; ESI MS (+ve) 763.9 [M+3H]³⁺/3, 573.4 [M+4H]⁴⁺/4; calc. m/z for C₁₀₈H₂₁₂N₃₃O₂₀³⁺ [M+3H]³⁺: 764.2, calc. m/z for C₁₀₈H₂₁₃N₃₃O₂₀⁴⁺ [M+4H]⁴⁺: 573.4.

- 65 -

xii. [CBz] NEOEOEN [Su(NPN)₂] [Lys]₁₆ [Boc]₃₂

DBL-OPNP (27.66 g, 59.2 mmol) was added in *ca.* 2-3 g portions to a solution of [CBz] NEOEOEN [Su(NPN)₂] [Lys]₈ [NH₂.TFA]₁₆ (13.83 g, 3.36 mmol) and TEA (13.1 g, 0.129 mol) in DMF (150 mL) at room temperature. After stirring for 17h, a solution of glycine (2.22 g, 29.6 mmol) in water (50 mL) was added. Stirring was continued for 3h and the solution was then added to rapidly stirred water (400 mL). The supernatant liquid was decanted from the resultant precipitated gum. The gummy material was dissolved in DMF (100 mL) and the solution added slowly to a well stirred mixture of flaked ice (500 g) and water (500 mL). The precipitated white solid was collected by filtration, resuspended in 5% w/v Na₂CO₃, sonicated and filtered again. The solid was washed thoroughly with water (4 x 100 mL) and dried to give the desired product (22.10 g, 87%) as a beige powder. ¹H-NMR (300 MHz, CD₃OD) δ (ppm) 1.10-1.95 (complex, 472H); 2.52 (m, 2H); 2.65 (m, 2H); 2.95-3.10 (complex, 30H); 3.10-3.30 (complex, 30H); 3.30-3.45 (complex, 12H); 3.45-3.65 (complex, 8H); 3.80-4.15 (complex, 16H); 4.20-4.45 (complex, 14H); 5.09 (s, 2H); 7.25-7.40 (complex, 5H). Due to insolubility in the HPLC mobile phase, HPLC and ESI MS data for this product could not be obtained. Instead, the BOC groups were removed and these data were obtained from the derived poly trifluoroacetate salt.

xiii. [NH₂] EOEOEN [Su(NPN)₂] [Lys]₁₆ [Boc]₃₂

Ammonium formate (6 mg, 95 mol) and 10% w/w palladium on activated carbon (28 mg) were added to a solution of [CBz] NEOEOEN [Su(NPN)₂] [Lys]₁₆ [Boc]₃₂ (348 mg, 46.13 mol) in DMF (4.5 mL) and water (0.5 mL). The mixture was stirred under nitrogen for 16h and then passed through a 0.54 μm filter. The solution was concentrated *in vacuo* then dissolved in methanol and concentrated *in vacuo* again to give [NH₂] EOEOEN [Su(NPN)₂] [Lys]₁₆ [Boc]₃₂ as a glassy solid (433 mg). ¹H-NMR (300 MHz, CD₃OD) δ (ppm) 1.10-1.90 (complex, 474H); 2.52 (m, 4H); 2.67 (m, 4H); 2.95-3.45 (complex, 80H); 3.55 (m, 8H); 3.63 (s, 8H); 3.85-4.50 (complex, 28H). HPLC (sample not soluble in LC compatible solvents). Absence of CBz signals in ¹H-NMR confirmed formation of product.

- 66 -

xiv. [*p*-NO₂-CBz] NEOEOEN [Su(NPN)₂] [Lys]₁₆ [Boc]₃₂

To a solution of [NH₂] EOEOEN [Su(NPN)₂] [Lys]₁₆ [Boc]₃₂ (287 mg, 0.038 mmol) in DMF (3 mL) was added DIPEA (20 μ L, 0.116 mmol) followed by 4-nitrobenzyl chloroformate (12 mg) with stirring. The solution was stirred at room temperature, under nitrogen for 16h. The volatiles were removed *in vacuo* to give the desired product (294 mg). TLC (10% MeOH/DCM) confirmed reaction was complete. ¹H-NMR (300 MHz, CD₃OD) δ (ppm) 1.10-1.90 (complex, 474H); 2.52 (m, 4H); 2.67 (m, 4H); 2.95-3.45 (complex, 80H); 3.55 (m, 8H); 3.63 (s, 8H); 3.85-4.50 (complex, 28H); 7.55 (d, 2H); 8.25 (d, 2H). HPLC (sample not soluble in LC compatible solvents).

10 xv. [*p*-NO₂-CBz] NEOEOEN [Su(NPN)₂] [Lys]₁₆ [NH₂.TFA]₃₂

To a stirred solution of [*p*-NO₂-CBz] NEOEOEN [Su(NPN)₂] [Lys]₁₆ [Boc]₃₂ (294 mg, 0.038 mmol) in DCM (4 mL) was added TFA (1 mL) at room temperature. The solution was stirred at room temperature for 16h. The volatiles were removed *in vacuo* and to the residue dissolved in 1:1 MeCN/H₂O (5 mL). The solvents were removed *in vacuo*. This process was repeated twice. The residue was triturated with diethyl ether (20mL) and the solvent removed by decanting. The residue was dried *in vacuo* to give the product as a white foam (354 mg). HPLC (Hydrophilic/TFA) Rt = 5.59 min; ESI MS (+ve) 4386 [M+H⁺]; calc. m/z for C₂₀₄H₃₉₉N₆₆O₃₈⁺ [M]⁺: 4384.77.

xvi. [*p*-NO₂-CBz] NEOEOEN [Su(NPN)₂] [Lys]₁₆ [PEG₅₇₀]₃₂

20 To a stirred solution of m-dPEG₅₇₀-NHS (1.24 g, 1.805 mmol) in DMF (0.5 mL) was added a solution of [*p*-NO₂-CBz] EOEOEN [Su(NPN)₂] [Lys]₁₆ [NH₂.TFA]₃₂ (410.4 mg, 0.052 mmol) and TEA (572 μ L, 4.103 mmol) in DMF (0.5 mL) dropwise. The solution was stirred at room temperature, under nitrogen for 16h. Volatiles were removed *in vacuo* and the residue was taken up into 50 mL water and purification was performed by
25 tangential flow filtration on a Centrimate (10 KDa membrane, 100 mL sample reservoir). The retentate was reduced to dryness to yield the desired product as an oily residue (906 mg, 78%). HPLC (Hydrophilic/TFA) Rt = 10.76 min. ¹H-NMR (300 MHz, CD₃OD) δ

- 67 -

(ppm) 1.10-1.90 (complex, Lys(3 x CH₂), 184H); 2.20-2.70 (complex, Lys(N-CH₂), 64H); 3.0-3.20 (complex, 58H); 3.35 (s, PEG-OMe, 96H); 3.40-3.90 (complex, PEG-CH₂, 1536H); 4.10-4.40 (broad s, 36H); 7.60 (d, *J* = 8.38 Hz, ArH, 2H); 8.20 (d, *J* = 8.33 Hz, ArH, 2H).

5 xvii. [NH₂] EOEOEN [Su(NPN)₂] [Lys]₁₆ [PEG₅₇₀]₃₂

This reaction was performed in the same way as Example 1xiii; using [*p*-NO₂-CBz] EOEOEN [Su(NPN)₂] [Lys]₁₆ [PEG₅₇₀]₃₂ (347 mg, 0.0153 mmol) with ammonium formate (68 mg, 1.08 mmol), 10% w/w palladium on activated carbon (320 mg) in DMF (6.4 mL) and water (0.6 mL). After workup this yielded the product as a glassy solid (310 mg, 90%).

10 ¹H-NMR (300 MHz, CD₃OD) δ (ppm) 1.10-1.90 (complex, Lys(3 x CH₂), 184H); 2.20-2.70 (complex, Lys(N-CH₂), 64H); 3.0-3.20 (complex, 58H); 3.35 (s, PEG-OMe, 96H); 3.40-3.90 (complex, PEG-CH₂, 1536H); 4.10-4.40 (broad s, 36H). HPLC (Hydrophilic/TFA) Rt = 10.69 min; ESI MS (+ve) 22,472 [M+4H⁺]; calc. m/z for C₁₀₂₈H₁₉₉₅N₆₅O₄₅₀⁺ [M]⁺: 22,468.01.

15 xviii. MAL-(CH₂)₂CONH-PEG₁₁₀₀-CO-NEOEOEN [Su(NPN)₂] [Lys]₁₆ [PEG₅₇₀]₃₂

To a stirred solution of MAL-PEG₁₁₀₀-NHS (1.25 mg, 0.895 μmol) in DCM (0.5 mL) was added a solution of [NH₂] EOEOEN [Su(NPN)₂] [Lys]₁₆ [PEG₅₇₀]₃₂ (20.1 mg, 0.895 μmol) and TEA (5 μL) in DCM (0.5 mL), dropwise. The solution was stirred at room temperature under nitrogen for 16h. Volatiles were removed under reduced pressure and the product

20 was used without further purification (21 mg). ¹H-NMR (300 MHz, CD₃OD) δ (ppm) 1.10-1.90 (complex, Lys(3 x CH₂), 184H); 2.20-2.70 (complex, Lys(N-CH₂), 64H); 3.0-3.20 (complex, 58H); 3.35 (s, PEG-OMe, 96H); 3.40-3.90 (complex, PEG-CH₂, 1628H); 4.10-4.40 (broad s, 36H); 6.82 (br s, MAL, 2H). HPLC (Hydrophilic/TFA) Rt = 10.72 min.

25 xix. β-Lactoglobulin-MAL-(CH₂)₂CONH-PEG₁₁₀₀-CO-NEOEOEN [Su(NPN)₂] [Lys]₁₆ [PEG₅₇₀]₃₂

A solution of MAL-(CH₂)₂CONH-PEG₁₁₀₀-CO-NEOEOEN [Su(NPN)₂] [Lys]₁₆ [PEG₅₇₀]₃₂ (13.0 mg, 10 equiv.) in PBS buffer (pH 7.64, 250 mL) was added to bovine β-lactoglobulin

- 68 -

B (1 mg, pH 7.64, 250 mL) in PBS buffer. The mixture was then shaken for 16h (600 rpm, 26 °C) and analysed by SDS-PAGE (12% Tris-Glycine Gel, 200 mV, 60 min), staining with coomassie blue and BaI₂. The desired dendrimer-protein construct was visualised by SDS-PAGE staining with coomassie blue, and appeared at the appropriate MW relative to the protein MW markers.

Example 2

β -Lactoglobulin-NHCO-PEG₅₇₀-NHCO(CH₂)₂-CO-NEOEOEN [Su(NPN)₂] [Lys]₁₆ [PEG₅₇₀]₃₂

i HO₂C-(CH₂)₂CO-NEOEOEN [Su(NPN)₂] [Lys]₁₆ [PEG₅₇₀]₃₂

10 To a stirred solution of succinic anhydride (5 mg, 0.047 mmol) in DMF (0.5 mL) was added a solution of [NH₂] EOEOEN [Su(NPN)₂] [Lys]₁₆ [PEG₅₇₀]₃₂ (Example 1xvii) (53 mg, 2.36 μ mol) and TEA (14 μ L) in DMF (0.5 mL), the solution was stirred at room temperature for 16h. Volatiles were removed *in vacuo* and the residue taken up into water, purification was performed by tangential flow filtration on a Centrimate (10 KDa

15 membrane). The retentate was reduced to dryness to yield the desired product as an oily residue (69 mg). HPLC (Hydrophilic/TFA) Rt = 10.83 min. ¹H-NMR (300 MHz, CD₃OD) δ (ppm) 1.10-1.90 (complex, Lys(3 x CH₂), 184H); 2.20-2.70 (complex, Lys(N-CH₂) + succinyl (CH₂)₂, 68H); 3.0-3.20 (complex, 58H); 3.35 (s, PEG-OMe, 96H); 3.40-3.90 (complex, PEG-CH₂, 1536H); 4.10-4.40 (broad s, 36H).

20 ii *t*-BuO₂C-PEG₅₇₀-NHCO(CH₂)₂-CO-NEOEOEN [Su(NPN)₂] [Lys]₁₆ [PEG₅₇₀]₃₂

To a stirred solution of HO₂C-(CH₂)₂CO-NEOEOEN [Su(NPN)₂] [Lys]₁₆ [PEG₅₇₀]₃₂ (30.6 mg, 1.36 μ mol), H₂N-PEG₅₇₀-CO₂*t*-Bu (22 mg, 0.033 mmol) and TEA (8 μ L) in DCM (0.5 mL) at 0 °C, was added a solution of DCC (6.2 mg, 0.03 mmol) and HOBt (4.6 mg, 0.034 mmol) in DMF (0.5 mL). The solution was stirred at 0 °C for 10 mins, then

25 allowed to reach room temperature and stirred for a further 16h under nitrogen. Volatiles were removed *in vacuo* and the residue taken up into water, purification was performed by tangential flow filtration on a Centrimate (10 KDa membrane). The retentate was reduced

- 69 -

to dryness to yield the desired product as an oily residue (29.5 mg). $^1\text{H-NMR}$ (300 MHz, CD_3OD) δ (ppm) 1.10-1.90 (complex, $\text{Lys}(3 \times \text{CH}_2) + \text{tBu}$, 193H); 2.20-2.70 (complex, $\text{Lys}(\text{N-CH}_2) + \text{succinyl}(\text{CH}_2)_2$, 68H); 3.0-3.20 (complex, 58H); 3.35 (s, PEG-OMe , 96H); 3.40-3.90 (complex, PEG-CH_2 , 1582H); 4.10-4.40 (broad s, 36H).

5 iii $\text{HO}_2\text{C-PEG}_{570}\text{-NHCO}(\text{CH}_2)_2\text{-CO-NEOEOEN} [\text{Su}(\text{NPN})_2] [\text{Lys}]_{16} [\text{PEG}_{570}]_{32}$

To a stirred solution of $t\text{-BuO}_2\text{C-PEG}_{570}\text{-NHCO}(\text{CH}_2)_2\text{-CO-NEOEOEN} [\text{Su}(\text{NPN})_2] [\text{Lys}]_{16} [\text{PEG}_{570}]_{32}$ (29.5 mg, 1.27 μmol) in DCM (2 mL) at room temperature, was added TFA (0.5 mL); this solution was stirred at room temperature for 2h. The reaction mixture was reduced to dryness and the residue taken up into 5mL 1:1 $\text{MeCN}/\text{H}_2\text{O}$, the solvents
 10 were then removed *in vacuo*. This dissolution in 1:1 $\text{MeCN}/\text{H}_2\text{O}$, followed by complete removal of the solvents, was repeated twice more (33.2 mg). $^1\text{H-NMR}$ (300 MHz, CD_3OD) δ (ppm) 1.10-1.90 (complex, $\text{Lys}(3 \times \text{CH}_2)$, 184H); 2.20-2.70 (complex, $\text{Lys}(\text{N-CH}_2) + \text{succinyl}(\text{CH}_2)_2$, 68H); 3.0-3.20 (complex, 58H); 3.35 (s, PEG-OMe , 96H); 3.40-3.90 (complex, PEG-CH_2 , 1582H); 4.10-4.40 (broad s, 36H).

15 iv $\text{NHS-CO-PEG}_{570}\text{-NHCO}(\text{CH}_2)_2\text{-CO-NEOEOEN} [\text{Su}(\text{NPN})_2] [\text{Lys}]_{16} [\text{PEG}_{570}]_{32}$

To a stirred solution of $\text{HO}_2\text{C-PEG}_{570}\text{-NHCO}(\text{CH}_2)_2\text{-CO-NEOEOEN} [\text{Su}(\text{NPN})_2] [\text{Lys}]_{16} [\text{PEG}_{570}]_{32}$ (33.2 mg, 1.43 μmol) and DIPEA (11 μL , 0.063mmol) in DCM (2 mL) was added DCC (12.2 mg, 0.059 mmol) as a solid, the solution was stirred at room temperature for 10 mins. NHS (5.2 mg, 0.045 mmol) in DCM (0.5 mL) was added and the solution
 20 stirred at room temperature under nitrogen for 16h. The volatiles were removed *in vacuo*, and DCM (2 mL) was added to the residue, the suspension was filtered through a 4.5 μm filter, the solvent was removed *in vacuo* (31.7 mg). This material was used without further purification.

v. $\beta\text{-Lactoglobulin-NHCO-PEG}_{570}\text{-NHCO}(\text{CH}_2)_2\text{-CO-NEOEOEN} [\text{Su}(\text{NPN})_2] [\text{Lys}]_{16}$
 25 $[\text{PEG}_{570}]_{32}$

$\text{NHS-CO-PEG}_{570}\text{-NHCO}(\text{CH}_2)_2\text{-CO-NEOEOEN} [\text{Su}(\text{NPN})_2] [\text{Lys}]_{16} [\text{PEG}_{570}]_{32}$ (10 eq. relative to protein) in PBS buffer (pH 7.64, 250 mL) was reacted with bovine β -

- 70 -

lactoglobulin B (pH 7.64). The mixture was shaken for 16h (600 rpm, 26 °C) and analysed by SDS-PAGE (12% Tris-Glycine Gel, 200 mV, 60 min), staining with coomassie blue and BaI₂. The desired dendrimer-protein construct was visualised by SDS-PAGE staining with coomassie blue, and appeared at the appropriate MW relative to the protein MW markers.

Example 3

HSA-MAL-(CH₂)₂CONH-PEG₁₁₀₀-CO-NEOEOEN [Su(NPN)₂] [Lys]₁₆ [PEG₅₇₀]₃₂

MAL-(CH₂)₂CONH-PEG₁₁₀₀-CO-NEOEOEN [Su(NPN)₂] [Lys]₁₆ [PEG₅₇₀]₃₂ (Example 1 xviii) (10 eq. relative to protein) in PBS buffer (pH 7.64, 250 mL) was reacted with human serum albumin (pH 7.64). The mixture was shaken for 16h (600 rpm, 26 °C) and analysed by SDS-PAGE (12% Tris-Glycine Gel, 200 mV, 60 min), staining with coomassie blue and BaI₂. The desired dendrimer-protein construct was visualised by SDS-PAGE staining with coomassie blue, and appeared at the appropriate MW relative to the protein MW markers.

Example 4

NDP- α -MSH-CH₂CO NEOEOEN [Su(NPN)₂] [GlyLys]₂ [ε-CBz]₂ [Lys]₂ [PEG₅₇₀]₄

i. HO-Su(NPN)₂ [CBz]₂

A mixture of (NPN)₂ [CBz]₂ (20.0 g, 0.05 mol) and succinic anhydride (6.0 g, 0.06 mol, 1.2 equivalents) in toluene (180 mL) was heated at 65 °C for 16h. The reaction was cooled to room temperature and the white solid filtered and washed with methyl-t-butyl ether (3 x 100 mL) to yield the product in good yield 23.54 g (94%).

ii. PNPO-Su(NPN)₂ [CBz]₂

To a stirred solution of 4-nitrophenol (1.91 g, 13.7 mmol) and HO-Su(NPN)₂ [CBz]₂ (13.7 mmol) in EtOAc (150 mL) was added a solution of DCC (2.97 g, 14.4 mmol) in EtOAc (50 mL) at room temperature. The mixture stirred at room temperature overnight, filtered

- 71 -

and washed with K_2CO_3 (1.0 M), brine 1:1 (3 x 300 mL), dried ($MgSO_4$), filtered and concentrated, providing 7.80 g of PNPO-Su(NPN)₂ [CBz]₂.

iii. [Boc] NEOEOEN [Su(NPN)₂] [CBz]₂

To a solution of [Boc] NEOEOEN (3 g, 12 mmol) in 1:1 DMF/DMSO (60 mL) was added
5 TEA (3.4 mL, 240 mmol) and a solution of PNPO-Su(NPN)₂ [CBz]₂ (7.5 g, 12 mmol) in DMSO (30 mL). The solution was stirred at room temperature for 15h. The solution was concentrated *in vacuo* and redissolved in water (300 mL). The aqueous solution was washed with EtOAc (3 x 300 mL) and the combined organic washings were dried over
10 Na_2SO_4 . Solvents were removed *in vacuo* and the crude oil purified by Silica Gel chromatography (3%MeOH/DCM) to provide [Boc] NEOEOEN [Su(NPN)₂] [CBz]₂ as a colourless viscous oil (8.2 g, 93%). HPLC (Hydrophilic/TFA) R_t = 9.20 min; ESI MS (+ve) 730.3 [M+1H]⁺; calc. m/z for $C_{37}H_{55}N_5O_{10}$: 729.9.

iv. [Boc] NEOEOEN [Su(NPN)₂] [NH₂]₂

To a solution of [Boc] NEOEOEN [Su(NPN)₂] [CBz]₂ (500 mg, 0.68 mmol) in
15 trifluoroethanol (13 mL) was added 10% w/w palladium on carbon (723 mg, 34 mmol). The suspension was stirred under an atmosphere of hydrogen at atmospheric pressure for 15h. The suspension was then filtered through a 0.2 μm filter and the filtrate concentrated *in vacuo* to provide [Boc] NEOEOEN [Su(NPN)₂] [NH₂]₂ as a clear oil (250 mg, 80%). HPLC (Hydrophilic/TFA) R_t = 4.50 min. ESI MS (+ve) 462.5 [M+H]⁺; calc. m/z for
20 $C_{21}H_{43}N_5O_6$: 461.6.

v. MeO-GlyLys [ϵ -CBz] [α -Boc]

To a stirred suspension of MeOGly.HCl (12.56 g, 0.11 mol) and DMF (200 mL) was slowly added TEA (42 mL, 0.30 mol) at room temperature. The active ester, PNPO- α -Boc- ϵ -CBz-Lys (50.15 g, 0.10 mol) was added to the suspension in 2-3 g portions. The bright
25 yellow mixture was stirred at room temperature for 18h. The volatiles were removed *in vacuo* and the resulting residue partitioned between EtOAc (200 mL), 10% Na_2CO_3 (100 mL) and water (175 mL). The organic layer was washed sequentially with 5% Na_2CO_3 (4 x

- 72 -

200 mL), 0.25 M HCl (3 x 50 mL) and brine (1 x 50 mL), dried (MgSO₄), filtered and concentrated to give the product as a colourless oil (44.39 g, 98%). HPLC (Hydrophobic/Formate) Rt = 5.22 min. ESI MS (+ve) 452.02 [M+H]⁺; calc. m/z for C₂₂H₃₃N₃O₇: 451.52.

5 vi. MeO-GlyLys [ε-CBz] [α-NH₂.TFA]

To a stirred, chilled solution of MeO-GlyLys [ε-CBz] [α-Boc] (43.4 g, 96.03 mmol) in acetic acid (150 mL) was added neat TFA in portions (total 170 mL). The reaction was stirred at room temperature for 5h. Volatiles were removed under reduced pressure; residual TFA and acetic acid were removed by azeotroping with methanol (5 x 200 mL).

- 10 The product was obtained as a pale yellow oil (46.04 g). HPLC (Hydrophilic/Formate) 12.33 min; ESI MS (+ve) 352 [M+H]⁺; calc. m/z for C₁₇H₂₅N₃O₅: 351.40.

vii. MeO-GlyLys [ε-CBz] [α-Lys] [Boc]₂

- To a stirred solution of MeO-GlyLys [ε-CBz] [α-NH₂.TFA] (96 mmol) in DMF (200 mL) was added TEA (33.5 mL, 0.24 mol) followed by DBL-OPNP (49.4 g, 0.106 mol). The solution was stirred at room temperature for 17h. A solution of glycine (3.98 g, 53 mmol) in water (50 mL) was added to the crude reaction mixture and stirring was continued for 18h further. Water (200 mL) was added and the yellow precipitate was collected by filtration, then resuspended in 5% Na₂CO₃ (200 mL); and stirred for 1.5h. The crude product was collected by filtration and resuspended in water (3 x 200 mL); the solids were collected by filtration and air dried to yield the product as a fine yellow powder (61.07 g, 94%). HPLC (Hydrophobic/Formate) Rt = 7.90 min; ESI MS (+ve) 680.15 [M+H]⁺; calc. m/z for C₃₃H₅₃N₅O₁₀: 679.82.
- 15
20

viii. MeO-GlyLys [ε-CBz] [α-Lys] [NH₂.TFA]₂

- To a stirred suspension of MeO-GlyLys [ε-CBz] [α-Lys] [Boc]₂ (4 g, 7.36 mmol) in acetic acid (15 mL) at 0 °C was added TFA (15 mL), dropwise. The mixture was allowed to warm to room temperature and was stirred at room temperature overnight. The solvents
- 25

- 73 -

were removed and the residue dissolved in water (100 mL) and filtered. The filtrate was lyophilized to give a colourless oil (4.4 g). HPLC/ (Hydrophilic/TFA) $R_t = 5.03$ min; ESI MS (+ve) = 480 $[M+H]^+$; calc. m/z for $C_{23}H_{37}N_5O_6$: 479.5.

ix. MeO-GlyLys [ϵ -CBz] [α -Lys] [PEG₅₇₀]₂

- 5 To a stirred suspension of MeO-GlyLys [ϵ -CBz] [α -Lys] [$NH_2 \cdot TFA$]₂ (735 mg, 1.04 mmol) in DMF (anhydrous, 20 mL) was added TEA (1.5 mL, 5 equivalents per amine) followed by a solution of m-dPEG₅₇₀-NHS (1.5 g, 1.05 equivalents per amine) in DMF (10 mL). The mixture was stirred at room temperature overnight. The solvents were removed and the residue purified on a column of silica gel (0.063-0.04 mm, eluents 7% ~30%
10 MeOH/DCM) to give the desired product as a colourless oil (1.0 g). HPLC (Hydrophilic/TFA) $R_t = 7.87$ min; ESI MS (+ve) 828 $[M+2xNH_4]^{2+}$, 811 $[M+2H]^{2+}$, 541 $[M+3H]^{3+}$; calc. m/z for $C_{75}H_{137}N_5O_{32}$: 1620.9.

x. HO-GlyLys [ϵ -CBz] [α -Lys] [PEG₅₇₀]₂

- To a stirred suspension of MeO-GlyLys [ϵ -CBz] [α -Lys] [PEG₅₇₀]₂ (1.0 g, 0.62 mmol) in
15 THF (20 mL) was added 1M LiOH (2 mL). The mixture was stirred at room temperature for 3 h; followed by acidification with 1 M HCl to pH 6. The solvents were removed and the residue dissolved in water and lyophilized to give the product as a colourless solid. HPLC (Hydrophilic/TFA) $R_t = 7.61$ min; ESI MS (+ve) 821 $[M+(2xNH_4)]^{2+}$, 804 $[M+2H]^{2+}$, 536 $[M+3H]^{3+}$; calc. m/z for $C_{74}H_{135}N_5O_{32}$: 1606.9.

20 xi. [Boc] NEOEOEN [Su(NPN)₂] [GlyLys]₂ [ϵ -CBz]₂ [Lys]₂ [PEG₅₇₀]₄

- To a stirred solution of [Boc] NEOEOEN [Su(NPN)₂] [NH_2]₂ (Example 4iv) (100 mg, 0.22 mmol) and HO-GlyLys [ϵ -CBz] [α -Lys] [PEG₅₇₀]₂ (700 mg, 0.44 mmol) in DMF (anhydrous, 9 mL) at 0 °C, was added PyBop (250 mg) and DIPEA (160 μ L). The mixture stirred at room temperature overnight. Volatiles were removed *in vacuo* to give a residue
25 which was chromatographed on a silica gel column (0.063-0.04 mm, eluants 10% -30% MeOH/DCM) to give 600 mg the product as a colourless oil. HPLC (Hydrophilic/TFA) R_t

- 74 -

= 9.18 min; ESI MS (+ve) 886 [M-Boc+4H]⁴⁺, 729 [M+5H]⁵⁺, 709 [M-Boc+5H]⁵⁺; data deconvoluted using transform calculation to give 3638.9[M+H]⁺; calc. m/z for C₁₆₉H₃₀₉N₁₅O₆₈: 3639.3.

xii. [TFA.NH₂] EOEOEN [Su(NPN)₂] [GlyLys]₂ [ε-CBz]₂ [Lys]₂ [PEG₅₇₀]₄

- 5 [Boc] NEOEOEN [Su(NPN)₂] [GlyLys]₂ [ε-CBz]₂ [Lys]₂ [PEG₅₇₀]₄ could be suspended in 20% TFA/DCM and stirred at room temperature for 1h. Removal of the volatiles should provide the product.

xiii. [ClCH₂CO] NEOEOEN [Su(NPN)₂] [GlyLys]₂ [ε-CBz]₂ [Lys]₂ [PEG₅₇₀]₄

- 10 To a solution of [TFA.NH₂] EOEOEN [Su(NPN)₂] [GlyLys]₂ [ε-CBz]₂ [Lys]₂ [PEG₅₇₀]₄ in buffer (100 mL 0.1 M Na₂HPO₄; 100 mL 0.1 M HCl, pH ~8.5) could be added chloroacetyl chloride. With stirring for 2 h, the product [ClCH₂CO] NEOEOEN [Su(NPN)₂] [GlyLys]₂ [ε-CBz]₂ [Lys]₂ [PEG₅₇₀]₄ should be detectable by HPLC/MS.

xiv. NDP-α-MSH-CH₂CO NEOEOEN [Su(NPN)₂] [GlyLys]₂ [ε-CBz]₂ [Lys]₂ [PEG₅₇₀]₄

- 15 To an excess of mercapto-NDP-α-MSH (mercapto-Ser-Tyr-Ser-Nle-His-DPhe-Arg-Trp-Gly-Lys-Pro-Val-NH₂) could be added a freshly prepared solution of [ClCH₂CO] NEOEOEN [Su(NPN)₂] [GlyLys]₂ [ε-CBz]₂ [Lys]₂ [PEG₅₇₀]₄ in a buffer of 0.1 M sodium hydrogen orthophosphate / 0.1 M HCl (pH 8.5). After stirring at room temperature for 16h, the conjugated product should be detectable in the reaction mixture by HPLC-MS.

Example 5

- 20 [Biotin] NEOEOEN [(Su(NPN)₂) [Lys]₁₆ [COCH₂O-3,6-Naph (SO₃Na)₂]₃₂

i. [Biotin] NEOEOEN [(Su(NPN)₂) [Lys]₁₆ [Boc]₃₂

PyBOP (20 mg, 0.04 mmol) was added to a stirred solution of [NH₂] EOEOEN [(Su(NPN)₂) [Lys]₁₆ [Boc]₃₂ (Example 1xiii) (109 mg, 0.015 mmol) in DMF/DMSO (1:1)

- 75 -

(3 mL). A solution of biotin-NHS ester (13 mg, 0.38 mmol) and DIPEA (40 μ L, 0.23 mmol) in DMF/DMSO (1:1) (2 mL) was added gradually. The mixture was stirred at room temperature for 16h. The reaction mixture was poured into MeCN (300 mL) and a precipitate formed. The precipitate was collected by filtration and dried *in vacuo* to give
 5 [Biotin] NEOEOEN [(Su(NPN)₂) [Lys]₁₆ [Boc]₃₂] as a white solid (119 mg, 106%). HPLC (Hydrophobic/TFA) Rt = 10.9 min; ESI MS (+ve) m/z = 1910.02 (M-4H)⁴⁺; 1528.33 (M-5H)⁵⁺. Data deconvoluted using maximum entropy calculation to give MW=7638 [M⁺]; calc. m/z for C₃₆₆H₆₆₅N₆₇O₁₀₀S (H form) [M⁺]: 7636.76.

ii. [Biotin] NEOEOEN [(Su(NPN)₂) [Lys]₁₆ [NH₂.TFA]₃₂]

10 A solution of TFA and DCM (1:1) (2 mL) was added dropwise to a stirred suspension of [Biotin] NEOEOEN [(Su(NPN)₂) [Lys]₁₆ [Boc]₃₂] (56 mg, 0.007 mmol) in DCM (3 mL). The mixture was stirred at room temperature for 14h. The solvent was removed under reduced pressure and the residue triturated with diethyl ether (3 x 10 mL). The product was dried *in vacuo* to give [Biotin] NEOEOEN [(Su(NPN)₂) [Lys]₁₆ [NH₂.TFA]₃₂] as a white
 15 solid. HPLC (Hydrophilic/TFA) Rt = 4.35 min; ESI MS (+ve) m/z = 1478.96 (M-3H)³⁺; 1109.38 (M-4H)⁴⁺; 887.70 (M-5H)⁵⁺; 739.84 (M-6H)⁶⁺. Data deconvoluted using maximum entropy calculation to give MW=4433 [M⁺], (H form); calc. m/z for C₂₀₆H₄₀₉N₆₇O₃₆S (H form) [M⁺]: 4433.01.

iii. [Biotin] NEOEOEN [(Su(NPN)₂) [Lys]₁₆ [COCH₂O-3,6-Naph(SO₃Na)₂]₃₂]

20 PyBOP (0.26 g, 0.50 mmol) was added to a stirred solution of [Biotin] NEOEOEN [(Su(NPN)₂) [Lys]₁₆ [NH₂.TFA]₃₂] (56 mg, 0.007 mmol) in DMF/DMSO (1:1) (6 mL). A solution of HOCOCH₂O-3,6-Naph(SO₃Na)₂ (0.21 g, 0.53 mmol) and DIPEA (0.4 mL, 2.30 mmol) in DMF/DMSO (1:1) (5 mL) was added gradually. The mixture was stirred at room temperature for 16h. The reaction mixture was poured into water (0.2 L) and filtered.
 25 Purification was performed by tangential flow filtration on a Centramate (2K membrane, 0.5 L sample reservoir). After an initial wash with Milli-Q water (5L) the retentate was washed with two aliquots of 1M Na₂SO₄ (100 mL) separated by a Milli-Q water wash (1 L), then filtration was continued until filtrate pH was neutral (approx. 5 L). The

- 76 -

retentate was concentrated *in vacuo*, and freeze dried to give [Biotin] NEOEOEN [(Su(NPN)₂) [Lys]₁₆ [COCH₂O-3,6-Naph(SO₃Na)₂]₃₂ as a white solid (80 mg, 68%). HPLC/MS (Ion Pairing) Rt = 8.74 min; ESI MS (-ve) m/z = 1544.32 (M-10H)¹⁰⁻; 1403.91 (M-11H)¹¹⁻; 1286.51 (M-12H)¹²⁻; 1187.62 (M-13H)¹³⁻; 1102.86 (M-14H)¹⁴⁻; 1029.21 (M-15H)¹⁵⁻; 964.96 (M-16H)¹⁶⁻; 907.83 (M-17H)¹⁷⁻; 857.56 (M-18H)¹⁸⁻; 812.29 (M-19H)¹⁹⁻; 771.62 (M-20H)²⁰⁻; 734.82 (M-21H)²¹⁻; 701.41 (M-22H)²²⁻; 670.74 (M-23H)²³⁻; 642.88 (M-24H)²⁴⁻; 617.15 (M-25H)²⁵⁻; 593.49 (M-26H)²⁶⁻; 571.50 (M-27H)²⁷⁻. Data deconvoluted using maximum entropy calculation to give MW=15453 [M⁻] (H form); calc. m/z for C₅₉₀H₆₆₅N₆₇O₂₉₂S₆₅ (H form) [M⁻]:15451.

10 Example 6

[Biotin] NEOEOEN [(Su(NPN)₂) [Lys]₁₆ [CO-3,5-Ph (SO₃Na)₂]₃₂

PyBOP (0.23 g, 0.44 mmol) was added to a stirred solution of [biotin] [NEOEOEN(Su(NPN)₂) [Lys]₁₆ [NH₂.TFA]₃₂ (Example 5ii) (48 mg, 0.006 mmol) in DMF/DMSO (1:1) (6 mL). A solution of 4-sulfobenzoic acid (0.12 g, 0.60 mmol) and
 15 DIPEA (0.3 mL, 1.72 mmol) in DMF/DMSO (1:1) (5 mL) was added gradually. The mixture was stirred at room temperature for 16h. The reaction mixture was poured into water (0.2 L) and filtered. Purification was performed by tangential flow filtration on a Centramate (1K membrane, 0.5 L sample reservoir). After an initial wash with Milli-Q water (5 L) the retentate was washed with two aliquots of 1M Na₂CO₃ (100 mL) separated
 20 by a Milli-Q water wash (1 L), then filtration was continued until filtrate pH was neutral (approx. 5 L). The retentate was concentrated *in vacuo*, and freeze dried to give [biotin] NEOEOEN [(Su(NPN)₂) [Lys]₁₆ [Ph-3,5-(SO₃Na)₂]₃₂ as a white solid (103 mg, 123%). HPLC/MS (Ion Pairing) Rt = 8.60 min; ESI MS (-ve) m/z = 919.70 (M-14H)¹⁴⁻; 858.30 (M-15H)¹⁵⁻; 804.56 (M-16H)¹⁶⁻; 757.08 (M-17H)¹⁷⁻; 715.01 (M-18H)¹⁸⁻; 677.48 (M-19H)¹⁹⁻; 643.61 (M-20H)²⁰⁻. Data deconvoluted using maximum entropy calculation to
 25 give MW=12889 [M⁻] (H form); calc. m/z for (C₄₃₀H₅₃₇N₆₇O₂₆₀S₆₅) (H form) [M⁻]: 12888.

Example 7

[Biotin] NEOEOEN [(Su(NPN)₂) [Lys]₈ [COCH₂O-3,6-Naph(SO₃Na)₂]₁₆

i. [Biotin] NEOEOEN [(Su(NPN)₂) [Lys]₈ [Boc]₁₆

PyBOP (20 mg, 0.04 mmol) was added to a stirred solution of [NH₂] EOEOEN
 5 [(Su(NPN)₂) [Lys]₈ [Boc]₁₆ (Example 7i) (55 mg, 0.015 mmol) in DMF (1:1) (3 mL). A
 solution of biotin-NHS ester (13 mg, 0.38 mmol) and DIPEA (20 µL, 0.12 mmol) in DMF
 (1 mL) was added gradually. The mixture was stirred at room temperature for 16h. The
 reaction mixture was poured into MeCN (0.2 L) and a precipitate formed. The precipitate
 was collected by filtration and dried *in vacuo* to give [Biotin] NEOEOEN [(Su(NPN)₂)
 10 [Lys]₈ [Boc]₁₆ as a white solid (34 mg, 58%). HPLC (Hydrophobic/TFA) Rt = 8.27 min;
 ESI MS (+ve) m/z = 1328.87 [(M-3H)³⁺]; 996.98 [(M-4H)⁴⁺]. Data deconvoluted using
 transform calculation to give MW=3984 [M⁺]; calc. m/z for C₁₉₀H₃₄₅N₃₅O₅₂S (H form)
 [M⁺]: 3984.10.

ii. [Biotin] NEOEOEN [(Su(NPN)₂) [Lys]₈ [NH₂.TFA]₁₆

15 A solution of TFA and DCM (1:1) (2 mL) was added dropwise to a stirred suspension of
 [Biotin] NEOEOEN [(Su(NPN)₂) [Lys]₈ [Boc]₁₆ (34 mg, 0.009 mmol) in DCM (3 mL).
 The mixture was stirred at room temperature for 14h. The solvent was removed under
 reduced pressure and the residue triturated with diethyl ether (3 x 10 mL). The product was
 dried *in vacuo* to give [Biotin] NEOEOEN [(Su(NPN)₂) [Lys]₈ [NH₂.TFA]₁₆ as a white
 20 solid. HPLC (Hydrophilic/TFA) Rt = 4.27 min; ESI MS (+ve) m/z = 1191.87 [(M-2H)²⁺];
 795.03 [(M-3H)³⁺]; 596.44 [(M-4H)⁴⁺]; 477.23 [(M-5H)⁵⁺]. Data deconvoluted using
 maximum entropy calculation to give MW=2382 [M⁺] (H form); calc. m/z for
 C₁₁₀H₂₁₇N₃₅O₂₀S (H form) [M⁺]: 2382.22.

iii. [Biotin] NEOEOEN [(Su(NPN)₂) [Lys]₈ [COCH₂O-3,6-Naph (SO₃Na)₂]₁₆

25 PyBOP (0.16 g, 0.31 mmol) was added to a stirred solution of [Biotin] NEOEOEN
 [(Su(NPN)₂) [Lys]₈ [NH₂.TFA]₁₆ (20 mg, 0.009 mmol) in DMF/DMSO (1:1) (4 mL). A

- 78 -

solution of $\text{HOCOCH}_2\text{O-3,6-Naph(SO}_3\text{Na)}_2$ (0.12 g, 0.28 mmol) and DIPEA (0.2 mL, 1.15 mmol) in DMF/DMSO (1:1) (2 mL) was added gradually. The mixture was stirred at room temperature for 16h. The reaction mixture was poured into water (0.25 L) and filtered. Purification was performed by tangential flow filtration on a Centrimate (2K membrane, 0.5 L sample reservoir). After an initial wash with Milli-Q water (5L) the retentate was washed with two aliquots of 1M Na_2CO_3 (100 mL) separated by a Milli-Q water wash (1 L), then filtration was continued until filtrate pH was neutral (approx. 5 L). The retentate was concentrated *in vacuo*, and freeze dried to give [Biotin] NEOEOEN [Su(NPN)_2] [Lys]₈ [$\text{COCH}_2\text{O-3,6-Naph(SO}_3\text{Na)}_2$]₁₆ as a white solid (69 mg, 94%). HPLC/MS (Ion Pairing) Rt = 10.8 min; ESI MS (-ve) m/z = 1314.25 (M-6H)⁶⁻; 1126.54 (M-7H)⁷⁻; 985.30 (M-8H)⁸⁻; 875.91 (M-9H)⁹⁻; 787.96 (M-10H)¹⁰⁻; 716.35 (M-11H)¹¹⁻; 656.60 (M-12H)¹²⁻; 605.97 (M-13H)¹³⁻; 562.90 (M-14H)¹⁴⁻; 525.03 (M-15H)¹⁵⁻. Data deconvoluted using maximum entropy calculation to give MW=7891 [M⁻] (H form); calc. m/z for $\text{C}_{302}\text{H}_{345}\text{N}_{35}\text{O}_{148}\text{S}_{33}$ (H form) [M⁻]: 7891.39. CE (pH 9); Rt = 8.00 min: 75.5% purity.

15 Example 8

$[p\text{-NO}_2\text{-CBz}]$ NEOEOEN [Su(NPN)_2] [Lys]₂ [$\text{Su(NPN)}_2(\text{PEG}_{1100})(\text{MTX-}\alpha\text{-OtBu})$]₄

To a stirred mixture of $\text{Su(NPN)}_2(\text{PEG}_{1100})(\text{MTX-}\alpha\text{-OtBu})$ (75 mg, 41.2 μmol) and $[p\text{-NO}_2\text{-CBz}]$ NEOEOEN [Su(NPN)_2] [Lys]₂ [$\text{NH}_2\cdot\text{TFA}$]₄ (8.4 mg, 8.2 μmol) in DMF (3.0 mL) at 0 °C was added PyBop (23 mg, 44 μmol) and DIPEA (29 μL , 0.16 mmol). The mixture was kept at 0°C for 30 min, then allowed to warm to room temperature overnight. The solvent was removed and the crude purified by PREP HPLC (Waters XTerra Prep RP₁₈ 10 μm , 19 x 250 mm, 5-45% ACN/H₂O, 15-55 min then hold, 0.1% TFA, Rt = 58 min) providing 40 mg (74%) of the desired product as a viscous yellow oil. ¹H-NMR (300 MHz, CD₃OD) δ (ppm) 1.48 (s, OtBu, 36H), 1.54-1.95 (complex, Lys(3 x CH₂) + NPN(2 x CH₂), 32H); 2.05-2.32 (complex, Glu(CH₂), 8H); 2.34-2.78 (complex, succinyl (CH₂)₂ + PEG-CH₂ + Glu(CH₂), 36H); 3.06-3.48 (complex, NPN(4 x CH₂) + PEG-Me + N-Me + Lys(N-CH₂), 68H); 3.50-4.06 (complex, PEG-OCH₂, 388H); 4.20-4.28 (complex, Lys(α -CH), 2H), 4.40-4.48 (complex, Glu(α -CH), 4H); 4.94 (s, N-CH₂, 8H); 5.20 (s, CBz-CH₂,

- 79 -

2H); 6.87 (d, 8.7 Hz, MTX, 8H); 7.58 (d, 8.4 Hz, *p*-NO₂-CBz, 2H); 7.78 (d, 8.7 Hz, MTX, 8H); 8.20 (d, 8.4 Hz, *p*-NO₂-CBz, 2H); 8.68 (s, MTX, 4H). HPLC (Hydrophilic/TFA) Rt = 9.58 min; ESI MS (+ve) 8,019 [M + H⁺]; calc. m/z for C₃₇₂H₆₄₅N₅₄O₁₃₄ [M + H⁺] 8,018.38.

5 Example 9

[CBz] NEOEOEN [Su(NPN)₂] [Lys]₄ [Su(NPN)₂(PEG₅₇₀)(MTX- α -OtBu)]₈

To a stirred mixture of Su(NPN)₂(PEG₅₇₀)(MTX- α -OtBu) (36 mg, 27.8 μ mol) and [CBz] NEOEOEN [Su(NPN)₂] [Lys]₄ [NH₂.TFA]₈ (6.0 mg, 2.8 μ mol) in DMF (2.0 mL) at 0 °C was added PyBop (16 mg, 30.6 μ mol) and DIPEA (16 μ L, 89 μ mol). The mixture was kept
 10 at 0 °C for 30 min, then allowed to warm to room temperature overnight. The solvent was removed and the crude purified by PREP HPLC (Waters XTerra Prep RP₁₈ 10 μ m, 19 x 250 mm, 5-45% MeCN/H₂O, 15-55 min then hold, 0.1% TFA, Rt = 58 min) providing 17 mg (53%) of the desired product as a viscous yellow oil. ¹H-NMR (300 MHz, CD₃OD) δ (ppm) 1.16-1.56 (complex, Lys(3 x CH₂) + NPN(2 x CH₂) + OtBu, 150H); 2.02-2.27
 15 (complex, Glu(CH₂), 16H); 2.30-2.75 (complex, succinyl (CH₂)₂ + PEG-CH₂ + Glu(CH₂), 68H); 3.00-3.42 (complex, NPN(4 x CH₂) + PEG-Me + N-Me + Lys(N-CH₂), 134H); 3.43-3.88 (complex, PEG-OCH₂, 380H); 4.04-4.32 (complex, Lys(α -CH), 7H), 4.34-4.50 (complex, Glu(α -CH), 8H); 4.91 (s, N-CH₂, 16H); 5.03 (s, CBz-CH₂, 2H); 6.83 (d, 8.7 Hz, MTX, 16H); 7.28 (br s, CBz, 5H); 7.75 (d, 8.7 Hz, MTX, 16H); 8.64 (s, MTX, 8H). HPLC
 20 (Hydrophilic/TFA) Rt = 9.41 min; ESI MS (+ve) 11,477.42 [M + H⁺]; calc. m/z for C₅₄₀H₈₉₀N₁₀₅O₁₆₄ [M + H⁺] 11,477.44.

Alternative / Key Intermediates**Example 10**

[CBz] NEOEOEN [Su(NPN)₂] [Lys]₁₆ [NH₂.TFA]₃₂

[CBz] NEOEOEN [Su(NPN)₂] [Lys]₁₆ [Boc]₃₂ (Example 1xii) (389 mg, 51.6 μmol) was dissolved in acetic acid (1.9 mL) and the stirred solution cooled in an ice bath until the acetic acid began to freeze. The ice bath was removed and TFA was carefully added until the acetic acid just melted. The stirred solution was once again placed in the ice bath and the remainder of the TFA (total amount of TFA used was 1.9 mL, 24.8 mmol) was added. The ice bath was removed and the solution stirred at room temperature for 21h. The TFA and acetic acid were evaporated *in vacuo* and water (5 mL) was added to the oily residue. The solution was then concentrated *in vacuo* and the process was repeated with more water (2 x 5 mL). The final oil was dissolved in water (5 mL), the solution filtered and freeze dried to give [CBz] NEOEOEN [Su(NPN)₂] [Lys]₁₆ [NH₂.TFA]₃₂ (397 mg, 96%) as an amorphous white solid. ¹H-NMR (300 MHz, D₂O) δ (ppm) 1.20-1.65 (complex, 92H); 1.65-1.85 (complex, 62H); 1.85-2.05 (complex, 30H); 2.51 (m, 2H); 2.61 (m, 2H); 2.95-3.10 (complex, 34H); 3.10-3.45 (complex, 38H); 3.55-3.70 (complex, 8H); 3.94 (t, *J* = 6.6 Hz, 8H); 4.05 (t, *J* = 6.6 Hz, 8H); 4.15-4.28 (complex, 8H); 4.28-4.39 (complex, 6H); 5.00 (s, 2H); 7.32-7.49 (complex, 5H); HPLC (Hydrophilic/TFA) *R*_t = 8.8 min; ESI MS (+ve) 1447.8 [M+3H]³⁺/3, 1086.1 [M+4H]⁴⁺/4, 868.9 [M+5H]⁵⁺/5, 724.3 [M+6H]⁶⁺/6; calc. *m/z* for C₂₀₄H₄₀₄N₆₅O₃₆³⁺ [M+3H]³⁺: 1447.1, calc. *m/z* for C₂₀₄H₄₀₅N₆₅O₃₆⁴⁺ [M+4H]⁴⁺: 1085.6, calc. *m/z* for C₂₀₄H₄₀₆N₆₅O₃₆⁵⁺ [M+5H]⁵⁺: 868.6, calc. *m/z* for C₂₀₄H₄₀₇N₆₅O₃₆⁶⁺ [M+6H]⁶⁺: 724.0.

Example 11

[CBz] NEOEOEN [Su(NPN)₂]₂ [Boc]₄

To a solution of [CBz] NEOEOEN [Su(NPN)₂] [Boc]₂ (11.8 g, 17 mmol) in acetic acid (25 mL), was added TFA (25 mL). The solution was stirred for 10h then quenched with water (100 mL). Solvent was removed *in vacuo* and the resulting oily residue dissolved in water

- 81 -

(50 mL) and filtered through a 4.5 μ m filter before freeze drying. The freeze dried material was dissolved in DMF (100 mL) and to this solution was added TEA (19 mL) and a solution of PNPO-Su(NPN)₂-Boc₂ (20.7 g, 21 mmol) in DMF (100 mL). The solution was left to stir at room temperature overnight. To the solution was then added a solution of
5 glycine (2 g) in water (120 mL). The combined solution was stirred at room temperature for 16h. Solvent was removed *in vacuo* and the resulting yellow precipitate redissolved in EtOAc (200 mL). This solution was then washed with water (50 mL), 0.5M HCl (50 mL) and 1M Na₂CO₃ (4 \times 50 mL). The organic layer was then dried over Na₂SO₄ and the solvent removed *in vacuo*. The resulting yellow oil was then purified by silica gel
10 chromatography to provide a clear viscous oil (18.5 g, 14 mmol, 82%). ESI MS (+ve) 562 [(M+2H⁺-2Boc)/2]; calc m/z for C₆₄H₁₁₁N₁₁O₁₈ [M+H]: 1323.63.

Example 12

[CBz] NEOEOEN [Su(NPN)₂]₄ [Boc]₈

To a solution of [CBz] NEOEOEN [Su(NPN)₂]₂ [Boc]₄ (12.8 g, 9.7 mmol) in acetic acid
15 (50 mL), was added TFA (50 mL). This solution was stirred overnight at room temperature after which solvent was removed *in vacuo* to provide a clear viscous oil. The oil was dissolved in DMF (75 mL) and to this solution was added a slurry of TEA (28 mL) and PNPO-Su(NPN)₂-[Boc]₂ (25.7 g, 47 mmol). The reaction mixture was stirred overnight at room temperature. To the reaction mixture was added a solution of glycine (2 g) in water
20 (60 mL). The combined solution was left to stir for a 16h. Solvent was removed *in vacuo* and the resulting yellow precipitate redissolved in EtOAc (400 mL). This solution was then washed with water (50 mL), 0.5M HCl (2 \times 50 mL) and 1M Na₂CO₃ (5 \times 50 mL). The organic layer was then dried over Na₂SO₄ and the solvent removed *in vacuo* to provide a yellow foam (24 g, 9.3 mmol, 96%). A portion of this material (22.5 g) was then purified
25 by silica gel chromatography (MeOH/DCM gradient) to provide a white foam (15 g, 5.8 mmol, 66%). ESI MS (+ve) 1289 [(M+2H⁺)/2]; 760 [(M+3H⁺-3Boc)/3]; calc. m/z for C₁₂₄H₂₁₉N₂₃O₃₄ [M+H]: 2577.3.

- 82 -

Example 13[CBz] NEOEOEN [Su(NPN)₂]₈ [Boc]₁₆

To a solution of 1:1 acetic acid/TFA (100 mL), was added [CBz] NEOEOEN [Su(NPN)₂]₄[Boc]₈ (12 g, 4.7 mmol). The reaction mixture was stirred at room temperature for 20h. Solvent was removed *in vacuo* and the clear residue redissolved in DMF (150 mL). To this solution was added a slurry of TEA (42 mL) and PNPO-Su(NPN)₂-Boc₂ (24.9 g, 45 mmol) in DMF (75 mL). The reaction mixture was left to stir at room temperature overnight. Solvent was removed *in vacuo* and the resulting yellow precipitate redissolved in EtOAc (2 L). This solution was then washed with brine (2 × 50 mL), 1M Na₂CO₃ (2 × 10 mL). Solvent was removed *in vacuo* to provide a yellow oil. ESI MS (+ve) 1695 [(M+3H⁺)/3]; 1272 [(M+4H⁺)/4]; 1018 [(M+5H⁺)/5]; calc. m/z for C₂₄₄H₄₃₅N₄₇O₆₆ [M+H]: 5084.3.

CLAIMS

1. A macromolecule comprising:
- 5 (i) a core moiety having a first amino nitrogen atom for attachment to a first functional moiety and at least two further amino nitrogen atoms for attachment to lysine or lysine analogue building units;
- (ii) a first functional moiety attached to the core moiety through the first amino nitrogen atom;
- 10 (iii) at least one layer of lysine or lysine analogue building units, the outermost layer having surface amino nitrogen atoms for attachment to one or more second functional moieties, said layers attached to the core moiety through the at least two further amino nitrogen atoms of the core moiety; and
- (iv) one or more second functional moieties attached to the surface amino nitrogen atoms of the outermost layer of lysine or lysine analogue building units;
- 15 wherein
- the first and second functional moieties comprise an agent selected from the group consisting of pharmaceutically active agents, interacting agents and pharmacokinetic modifying agents.
2. A macromolecule according to claim 1 wherein the building units are selected from:
- 20

Lysine* 1 having the structure:

- 84 -

Glycyl-Lysine* **2** having the structure:

Analogue **3**, having the structure below, where a is an integer 1 or 2; and b and c are independently integers 1, 2, 3 or 4.

Analogue **4**, having the structure below, where a is an integer 0, 1 or 2; and b and c are independently integers 2, 3, 4, 5 or 6

Analogue* **5**, having the structure below, where a is an integer 0, 1, 2, 3, 4 or 5; and b and c are independently integers 1, 2, 3, 4 or 5

Analogue **6**, having the structure below, where a is an integer 0, 1, 2, 3, 4 or 5; and b and c are independently integers 0, 1, 2, 3, 4 or 5

- 85 -

Analogue 7, having the structure below, where a is an integer 0, 1, 2, 3, 4 or 5; and b and c are independently integers 1, 2, 3, 4 or 5

5 Analogue 8, having the structure below, where a is an integer 0, 1, 2, 3, 4 or 5; and b, c and d are independently integers 1, 2, 3, 4 or 5

- 86 -

Analogue 9, having the structure below, where a is an integer 0, 1, 2, 3, 4 or 5; and b and c are independently integers 1, 2, 3, 4 or 5

and wherein any methylene group of the building units may be replaced by a methyleneoxy (CH₂-O) or ethyleneoxy (CH₂-CH₂-O) group, provided that this does not result in the formation of a carbonate (-O-C(O)-O-) or carbamate (-O-C(O)-N-) moiety within the building unit.

3. A macromolecule according to claim 2 wherein the building units are selected from Lysine 1, Glycyl-Lysine 2 or Lysine analogue 5:

where a is an integer 0, 1 or 2 and wherein any methylene group of 1, 2 or 5 may be replaced by a methyleneoxy or ethyleneoxy group provided that this does not result in the formation of a carbonate or carbamate moiety within the building unit.

4. A macromolecule according to any one of claims 1 to 3 wherein the core is a triamino compound resulting from the reaction of lysine, or a lysine analogue, with one amino nitrogen atom of a diamino compound selected from:

- 87 -

where a is an integer of 1 to 9, for example 1, 2, 3, 4 or 5;

where a, b and c, are independently integers 1, 2, 3, 4 or 5, such as 2 or 3; and d is an integer from 0-100, such as 1-30; particularly 1-5, 6-10, 11-15, 16-20, 21-25 or 26-30;

where a and b, are independently integers 0, 1, 2, 3, 4 or 5;

where a and c, are independently integers 1, 2, 3, 4, 5 or 6 and where c is an integer from 0, 1, 2, 3, 4, 5 or 6;

where a and d, are independently integers 1, 2, 3, 4, 5 or 6 and where b and c, are independently integers 0, 1, 2, 3, 4, 5 or 6.

- 88 -

5. A macromolecule according to claim 4 wherein the diamino compound is selected from the following:

where a is an integer 1, 2, 3, 4 or 5;

where a, b and c, are independently integers of 2 or 3 and d is an integer from 1-30;

where a and d, are independently integers of 1 or 2 and where b and c, are independently integers from 0, 1 or 2.

10 6. A macromolecule according to claim 5 wherein the core is derived from compound 11, wherein a, b, c and d are each 1 and analogue 5 wherein each of a, b and c are 2.

7. A macromolecule according to any one of claims 1 to 4 wherein the core is a triamino or tetra amino compound, or a tetramino or pentamino compound resulting from the reaction of a lysine or a lysine analogue with one amino nitrogen atom of a triamino or
15 tetramino compound wherein the triamino and tetraamino compounds are selected from:

- 89 -

where a, b and c, are independently integers 1, 2, 3, 4, 5 or 6;

where a, b and c, are independently integers 0, 1, 2, 3, 4, 5 or 6;

5

- 90 -

where a, b and c, are independently integers 0, 1, 2, 3, 4, 5 or 6;

where a, b and c, are independently integers 0, 1, 2, 3, 4, 5 or 6; and d, e and f, are
5 independently integers 1, 2, 3, 4, 5 or 6,

- 91 -

where a, b, c and d, are independently integers 0, 1, 2, 3, 4, 5 or 6

where a, b, c and d, are independently integers 1, 2, 3, 4, 5 or 6

5

where a, b, c and d, are independently integers 0, 1, 2, 3, 4, 5 or 6; and e, f, g and h, are independently integers 1, 2, 3, 4, 5 or 6.

- 92 -

8. A macromolecule according to claim 6 wherein the triamino or tetraamino compound is selected from:

where a, b and c, which may be the same or different, are integers of 1 to 2;

5

where a, b and c, are independently integers 0, 1 or 2; and d, e and f, are independently integers 1 or 2,

or a tetramine compound

- 93 -

where a, b, c and d, are independently integers 0 or 1

where a, b, c and d, are independently integers 1 or 2;

5

where a, b, c and d, are independently integers 0, 1 or 2; and e, f, g and h, are independently integers 1 or 2.

- 94 -

9. A macromolecule according to any one of claims 1 to 8 comprising 1, 2, 3, 4 or 5 layers of building units.
10. A macromolecule according to claim 9 comprising 2, 3 or 4 layers of building units.
- 5 11. A macromolecule according to any one of claims 1 to 10 further comprising at least one third functional moiety on the surface.
12. A macromolecule according to any one of claims 1 to 11 wherein each surface amino nitrogen atom is attached to a functional moiety.
13. A macromolecule according to any one of claims 1 to 12 wherein the first
10 functional moiety comprises a pharmaceutically active agent.
14. A macromolecule according to any one of claims 1 to 13 wherein the second functional moiety comprises a pharmaceutically active agent.
15. A macromolecule according to claim 1 wherein the pharmaceutically active agent is a peptide.
- 15 16. A macromolecule according to any one of claims 1 to 12 wherein the first and/or second, and/or optionally a third functional moiety comprises a pharmacokinetic modifying agent.
17. A macromolecule according to claim 16 wherein the pharmacokinetic modifying agent is a polyethylene glycol.
- 20 18. A macromolecule according to claim 1 wherein the first and/or second functional moiety is an interacting agent.
19. A macromolecule according to any one of claims 1 to 12 having a combination of functional moieties as defined in Table 1.

- 95 -

20. A macromolecule according to any one of claims 1 to 19 wherein one or more functional moieties are attached to the core or surface amino nitrogen atoms *via* a linker.
21. A macromolecule according to claim 20 wherein the linker is a polyethylene glycol linker having from 1 to 100 repeat units.
- 5 22. A macromolecule according to any one of claims 1 to 21 wherein a first core or surface nitrogen atom, and/or any linker and/or the functional moiety is modified by a modifier group to facilitate attachment.
23. A macromolecule according to claim 21 wherein the modifier group may be selected from maleimide, haloacetamide, hydrazide, alkoxyamine or 3-(2-
10 pyridyldithio)propionate.
24. A composition comprising a macromolecule according to any one of claims 1 to 23 and at least one pharmaceutically acceptable excipient, carrier or adjuvant therefor.
25. Use of a macromolecule according to claim 1 in therapy.

INTERNATIONAL SEARCH REPORT

International application No.

A. CLASSIFICATION OF SUBJECT MATTER

Int. Cl. 8

C08G 69/10 (2006.01)

C08G 73/10 (2006.01)

C08G 83/00 (2006.01)

A61K 31/785 (2006.01)

A61K 38/07 (2006.01)

A61K 38/05 (2006.01)

A61K 38/08 (2006.01)

According to International Patent Classification (IPC) or to both national classification and IPC

B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

Electronic database searched: see below

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practicable, search terms used)

Keyword search on STN of medline, WPIDS, CA, Biosis. Keywords: ?lys?, ?lysine, dendrimer, 'dendrimer polymer', dentritic(w)polymer, imag?, signal?, contrast, contrast(w)agent, polyvalent, therap?, link?

C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category*	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
X	Roy, R. et al, "Glycodendrimers: novel glycotope isosteres unmasking sugar coding. Case study with T-antigen markers from breast cancer MUC1 glycoprotein", Reviews in Molecular Biotechnology, Vol. 90 (2002), pp. 291-309 See scheme 2 p. 296, schemes 9-10, pages 304-305	1-2, 11-15, 24-25
X	WO 1999 001160 A (SCHERING AG) 14 January 1998 See claim 1 inter alia.	1-2, 11-14, 24-25

☒ Further documents are listed in the continuation of Box C☒ See patent family annex

* Special categories of cited documents:

"A" document defining the general state of the art which is not considered to be of particular relevance

"E" earlier application or patent but published on or after the international filing date

"I" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)

"O" document referring to an oral disclosure, use, exhibition or other means

"P" document published prior to the international filing date but later than the priority date claimed

"T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention

"X" document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone

"Y" document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art

"&" document member of the same patent family

Date of the actual completion of the international search

INTERNATIONAL SEARCH REPORT

Information on patent family members

International application No.

PCT/AU2007/001126

This Annex lists the known "A" publication level patent family members relating to the patent documents cited in the above-mentioned international search report. The Australian Patent Office is in no way liable for these particulars which are merely given for the purpose of information.

Patent Document Cited in Search Report				Patent Family Member
